[Cd. 6021.]

- Government Publications** (with the exceptions mentioned in paragraphs 2 to 6) can be bought, either directly or through any bookseller, from—
WYMAN AND SONS, LTD., Fetter Lane, London, E.C.; or
OLIVER AND BOYD, Tweeddale Court, Edinburgh; or
E. PONSONBY, LTD., 116, Grafton Street, Dublin.
Booksellers, and the accredited agents of Free Public Libraries, are entitled to a discount of 25 per cent. from published prices.
- Hydrographical Publications of the Admiralty** are sold by—
J. D. POTTER, 145, Minories, London, E.C.
- Patent Office Publications** are sold at—
The Patent Office, 25, Southampton Buildings, Chancery Lane, London, W.C.
(N.B.—Classified Abridgments of Patent Specifications are sold also by Wyman and Sons, Ltd.)
- Ordnance Survey and Geological Survey Publications** can be purchased from—The Director General of the Ordnance Survey, Southampton; or
The Superintendent, Ordnance Survey, Dublin; or
Agents in most of the chief towns in the United Kingdom.
(N.B.—Small Scale Maps are, as a rule, procurable at Railway Bookstalls in England and Wales.)
- The **Journal of the Board of Agriculture** is published monthly by the Board, at 4, Whitehall Place, London, S.W. Price 4d.
- The **London Gazette** is published on Tuesday and Friday evenings by—
Wyman and Sons, Ltd. Price 1s.

The following is a list of some of the more important Parliamentary and Official Publications recently issued:—

Statutes—

- Public General Acts, Local and Personal Acts, 1911.* In separate Acts, at varying prices.
- Public General, Session 1910.* With Index, Tables, &c. Cloth 3s.
- Second Revised Edition. 1235–1900.* Vols. I. to XX. 7s. 6d. each.
- Statutes in Force. Chronological Table and Index of.* 26th Edition. To the end of the Session 10 Edward VII. and 1 Geo. V. (1910). 2 vols. 10s. 6d.
- Interregnum, 1642–1660. Acts and Ordinances of the.* In 3 vols. (not sold separately). 30s.
- Acts of the Parliaments of Scotland, 1424–1707. Revised Edition.* 10s.
- Statutory Rules and Orders* other than those of a Local, Personal, or Temporary Character. Issued in 1890 to 1910. 10s. each.
- Statutory Rules and Orders revised, in force on Dec. 31, 1903.* Vols. I. to XIII. 10s. each.
- Statutory Rules and Orders in force on 31st December 1909.* Index to. 10s.
- PARLIAMENTARY DEBATES.** House of Lords and House of Commons; each daily part 3d; also issued in bound volumes with Index.
- MINUTES OF PROCEEDINGS OF THE HOUSE OF LORDS.** 1d. per 4 pp. Subscription, Session 1911, 30s.
- VOTES AND PROCEEDINGS OF THE HOUSE OF COMMONS.** 1d. per 8 pp. Subscription, Session 1911, 30s.
- HISTORICAL MANUSCRIPTS.** Reports of the Royal Commissioners. In course of issue.
- RAILWAY CONCILIATION SCHEME OF 1907.** Royal Commission. Report, Evidence, and Appendices. [Cd. 5922, 6014.] 6s. 5d.
- LABOUR DEPARTMENT.** Directory of Industrial Associations. 1911. [Cd. 5619.] 11d.
- FACTORIES AND WORKSHOPS.** Report. 1910. [5693.] 2s. 4d.
- SWINE FEVER COMMITTEE.** Report, Evidence. [Cd. 5671, 5680.] 3s. 5d.
- CENSUS, ENGLAND AND WALES, 1911.** Preliminary Report and Tables. [Cd. 5705.] 1s. 1d.
- Do. IRELAND. [Cd. 5691.] 2s. 6d.
- Do. SCOTLAND. [Cd. 5700.] 10s.
- TUBERCULOSIS—HUMAN AND BOVINE.** Final Report of Royal Commission. [Cd. 5761.] 6d.
- EDUCATIONAL ENDOWMENTS COMMITTEE.** Report, Evidence, &c. [Cd. 5662, 5747.] 2s. 8d.
- RAILWAY RETURNS, UNITED KINGDOM, 1910.** Capital, Traffic, Receipts, Expenditure, &c. [Cd. 5796.] 1s. 6d.
- TRADE, UNITED KINGDOM, 1910.** Annual Statement. [Cd. 5699, 5852, 5853.] 11s. 6d.
- COAST EROSION AND AFFORESTATION (Royal Commission).** Final Report, with Evidence and Appendices. [Cd. 5708, 5709.] 9s. 10d.
- EARNINGS AND HOURS OF LABOUR, UNITED KINGDOM, ENQUIRY.** Metal Engineering and Shipbuilding Report. [Cd. 5814.] 2s.
- LICENSING STATISTICS, ENGLAND AND WALES, 1910.** [Cd. 5816.] 2s. 5d.
- STATISTICAL ABSTRACT, UNITED KINGDOM.** Years 1896 to 1910. [Cd. 5841.] 1s. 9d.
- COMPANIES LAWS IN THE BRITISH EMPIRE.** Analysis. [Cd. 5864.] 4s. 6d.

AGRICULTURAL STATISTICS OF GREAT BRITAIN.

The annual AGRICULTURAL STATISTICS for 1910 are issued in four parts, as follows:—

Part I. (Cd. 5585, price 5½d.).

Report.

Tables: Section I.—Area under Crops and Live Stock.

“ “ II.—Value of Land.

Part II. (Cd. 5604, price 5d.).

Report.

Tables: Section III.—Produce of Crops.

“ “ IV.—Weather Statistics.

Part III. (Cd. 5786, price 9d.).

Report.

Tables: Section V.—Prices of Corn and Bread.

“ “ VI.—Prices of Live Stock and other Agricultural Produce.

“ “ VII.—Supply of Live Stock at Markets.

“ “ VIII.—Trade in Live Stock with Ireland.

“ “ IX.—Imports of Agricultural Produce.

“ “ X.—Exports of Agricultural Produce.

Part IV. Foreign and Colonial Statistics. (*In the press.*)

NOTE.—These publications may be purchased (either directly or through a bookseller) only from the agents mentioned on the title-page.

BOARD OF AGRICULTURE AND FISHERIES.

AGRICULTURAL STATISTICS, 1911. PART I.

REPORT

To the Secretary of the Board of Agriculture and Fisheries.

SIR,

I BEG to submit the first Part of the Volume of Agricultural Statistics for 1911, containing returns of the acreage of crops and the number of live stock in Great Britain as collected in June last.

The collection was again undertaken by the Commissioners of Customs and Excise, to whom the thanks of the Board are due for the efforts made under considerable difficulty to accelerate the completion of the work so as to avoid the serious delay which in the two previous years had occurred in forwarding the abstracts of the returns to this Department. A considerable improvement was effected as compared with 1910, but unfortunately it was still not found possible to revert to the arrangement which for many years prior to 1909 had existed, whereby all the returns were in the hands of the Board before the end of August. The last returns were received this year on the 23rd September, and the Preliminary Statement containing the totals for Great Britain was issued on the 26th September. The usual summary of the county figures for the principal crops and for each kind of stock was prepared and forwarded during the last fortnight of October to every occupier of more than 20 acres. The collection of the returns in the Isle of Man and the Channel Islands was again undertaken by the respective Lieutenant Governors, and the returns for Ireland, which are included for convenience of reference, were supplied as usual by the Department of Agriculture and Technical Instruction.

Prior to the year 1906 the agricultural statistics for the year had been issued in one volume, but in that year it was decided to issue the volume in four parts. This appears to have been found convenient, as it not only enables the various sections to be issued as the figures become available, but also allows

those who are interested in particular tables to obtain them at a small cost without having to purchase the whole volume. I propose this year to make a further extension of the same principle by dividing the third part—which now contains tables relating to prices, supplies at markets, imports and exports—into two. One advantage of this will be that the prices for the year ending, 31st December, collected by the Board's Market Reporters, can be issued at an earlier date; without waiting for the figures relating to imports and exports which necessarily take longer to compile. The volume for this year therefore will be issued in five parts, viz. :—

I.—Acreage and live stock.

II.—Produce of crops.

III.—Prices and supplies at markets.

IV.—Imports and exports of agricultural products.

V.—Agricultural returns of the British Empire and foreign countries.

AREA UNDER CULTIVATION.

The total land area of Great Britain, according to the latest figures supplied by the Ordnance Survey, is 56,214,419 acres, and of this 32,094,658 acres are returned as under crops or permanent grass—usually termed the “cultivated area”—and 12,875,660 acres as mountain and heath land used for grazing, or, in other words, rough pasturage treated as supplementary to the ordinary farming area. The distribution as between the three countries is as follows :—

	Total Area.		Cultivated Area.		Rough Grazings.	
	Acres.	Per Cent.	Acres.	Per Cent.	Acres.	Per Cent.
England	32,394,302	58	24,478,426	76	2,463,482	19
Wales	4,749,651	8	2,770,397	9	1,342,754	10
Scotland	19,070,466	34	4,845,835	15	9,069,424	71
Great Britain	56,214,419	100	32,094,658	100	12,875,660	100

If the cultivated area and rough grazings are added together as forming the extent of land occupied for agricultural purposes, it appears that England has 60 per cent., Wales 9 per cent., and Scotland 31 per cent. of the total. If, on the other hand, a still stricter definition of cultivation be adopted and a comparison be made of arable land only, it appears that of the 14,647,788 acres returned as actually under the plough in 1911, England had 72 per cent., Wales 5 per cent., and Scotland 23 per cent.

The cultivated area—i.e., the acreage returned as under crops or grass—declined in 1911 by 51,272 acres, but on the other hand, the area returned as mountain and heath land used for grazing increased by 31,434 acres, so that the withdrawal of land from agricultural or pastoral purposes was in round figures 20,000 acres. As has previously been remarked, the steady annual decline of the farming area has been so regular a feature of the returns for many years past that it can only be attributed to a persistent influence. To some extent, as in the present year, the loss may sometimes be partially accounted for by a transference of grass-land from the category of "permanent pasture" to that of "rough grazings." This may represent, perhaps, a deterioration of the land, but it does not signify its conversion to non-agricultural uses. In any case such a transference does not affect the general trend of the figures. During the last 10 years the reduction of the cultivated area has amounted to 323,000 acres, and that of the rough grazings to 55,000 acres. It appears, therefore, that 378,000 acres have been, during that period, withdrawn from farming altogether and devoted to some other use. It might be contended that this steady shrinkage of the farming area denotes a slow abandonment, under economic pressure, of the least profitable land—a gradual restriction of the "margin of cultivation." In some years as, for instance, in the "nineties," this may, and, no doubt, did occur to a considerable extent, and, in view of the large proportion of, comparatively speaking, poor land in Great Britain, it cannot be said that this does not still sometimes happen. But, broadly speaking, this loss of agricultural land may, without much hesitation, be attributed mainly to the extension of the towns and the demands for more and more of the surface of the country for residential, manufacturing, mining, railway, and other purposes requisite to an ever-growing population. The rate at which the towns encroach upon the country cannot be calculated with any degree of accuracy owing to the difficulty of determining the areas which can properly be classed as urban. The classification for local government purposes of urban and rural districts is, of course, only a very approximate guide, as there is a certain proportion of farm land in "urban" districts and a considerable number of small towns in "rural" districts. But as a general indication it may be noted that according to the Preliminary Report on the Census of 1911 the total extent of land in urban areas in England and Wales is now 4,015,697 acres, showing an increase of 166,710 acres, or 4·33 per cent. since the previous Census in 1901.

While the net loss of the farming area of the country during ten years may be put at about 0·8 per cent., the reduction of arable land during the same period has amounted to about 6 per cent. In England 661,000 acres, in Wales 158,000 acres, in Scotland 123,000 acres were withdrawn from the plough.

between 1901 and 1911. In the present year the reduction of arable land was, however, less than in any year since 1902, and in some parts of the country there was an increase. Thus, in the eastern districts of England, 9,300 acres, and in the north-western counties 4,800 acres, were returned to the plough. On the other hand, 31,000 acres were withdrawn from the plough in the northern, west midland, and south-western counties. In Wales there was a loss of 4,000 acres, and in Scotland an increase of 5,000 acres in the north-east was counterbalanced by a corresponding loss in the south-west.

AGRICULTURAL HOLDINGS.

The total number of agricultural holdings coming within the scope of these returns—i.e., exceeding one acre in extent—in June 1911 was 513,259. The figures for each class of holding, in 1911 and 1910, are shown below :—

	1 to 5 acres.		5 to 50 acres.		50 to 300 acres.		Over 300 acres.	
	1911.	1910.	1911.	1910.	1911.	1910.	1911.	1910.
England - -	82,538	80,429	167,628	166,155	110,110	109,981	14,377	14,531
Wales - -	10,210	10,234	32,112	31,984	17,965	17,996	370	364
England and Wales - -	92,748	90,663	199,740	198,139	128,075	127,977	14,747	14,895
Scotland - -	17,848	17,889	34,300	34,446	23,122	23,125	2,679	2,674
Great Britain -	110,596	108,552	234,040	232,585	151,197	151,102	17,426	17,569

The number of holdings of the smallest class—1 to 5 acres—increased in England and Wales by 2,085, and in the 5 to 50-acre class by 1601, being a total increase of 3,686 in the number of “small holdings” during the year 1910–11. The significance of this increase is apparent if the figures for the past nine years—the period during which these returns have been annually abstracted on the same basis—are examined. The number of holdings exceeding 1 and not exceeding 50 acres in England and Wales respectively in each of the years 1903 to 1911 was as under :—

Year.		England.	Wales.	Total England and Wales.
1903	- - - -	248,936	41,735	290,671
1904	- - - -	248,104	41,895	289,999
1905	- - - -	247,854	42,013	289,867
1906	- - - -	246,934	41,992	288,926
1907	- - - -	246,896	42,197	289,093
1908	- - - -	245,102	42,074	287,176
1909	- - - -	245,856	42,155	288,011
1910	- - - -	246,584	42,218	288,802
1911	- - - -	250,166	42,322	292,488

From 1903 to 1908 in England small holdings declined steadily, and although in Wales there was no general tendency, the lowest point in England and Wales as a whole was reached in 1908. This continued decline was only consistent with the tendency disclosed by previous periodic returns at various dates. Thus in 1890 the number was calculated at 309,290, and in 1895 it had fallen to 299,378. Since 1908, however, the tide has turned, and in three years there has been an increase of 5,312 or nearly 2 per cent.

In a closer examination of the returns of small holdings made in last year's Report (Cd. 5585) attention was drawn to the fact that these figures represent only net increase and not the number of new small holdings created. The contraction of the cultivated area year by year involves the disappearance of a number of holdings, and probably small holdings are swallowed up by urban encroachments in greater numbers than larger farms. Indeed to this cause the diminution of small holdings in earlier years was largely attributed. Not only, therefore, has the creation of small holdings since 1908 been sufficient to make good this wastage, but to increase substantially the total number of small holdings in the country. This is conveniently exhibited in the following diagram, which shows the steady reduction of the cultivated area and the decline and increase of small holdings—1 to 50 acres—in England and Wales during the past nine years:—

LAND FARMED BY OWNERS.

Of the total number of holdings in Great Britain included in these returns 60,217 or 11.73 per cent. are owned by their occupiers. Of these, 43,239 are small holdings, i.e., from 1 to 50 acres, and the proportion of occupying ownerships in this class is in England and Wales, though not in Scotland, higher than in that of the larger holdings. In England, 14.20 per cent.; in Wales, 10.17 per cent.; and in Scotland, 6.53 per

cent. of the small holdings are owner-farmed. The proportions differ widely in different districts (*see* Table 13). It is highest (excluding London) in Surrey, where it reaches 31·45 per cent., and where the proportion of holdings not "farmed for business" (*see* Table 6) is also higher than in any other county (again excluding London). The other English counties in which the proportion of small holdings occupied by owners exceeds 20 per cent. of the total are Berkshire, Essex, Hampshire, Middlesex, Oxfordshire, and West Sussex. The counties in which the proportion is less than 10 per cent. are Cheshire, Derby, Northumberland, North Riding, and the Soke of Peterborough. In Wales the occupying ownership of small holdings is most prevalent in Cardigan (17·42 per cent.), Radnor, Carmarthen, Pembroke, and Anglesey, but in no other county does the proportion reach 10 per cent.

It is only during the past four years that the returns showing in the case of each holding whether it is "owned or mainly owned" have been obtained, but for a much longer period returns are available of the acreage owned or rented by the occupiers. These returns take into account, and divide, that part of a single holding which is owned from that which is rented. Since 1888 there has been an almost uninterrupted decline in the proportion of the acreage owned by the occupiers. In that year it was for the whole of Great Britain 15 per cent. In 1911 it had fallen to 11·89 per cent. The tendency has been not only continuous but general all over the country. The following statement shows the proportion in quinquennial averages from 1890 to 1909, with the two latest single years, in each of the agricultural divisions.

	1890- 1894.	1895- 1899.	1900- 1904.	1905- 1909.	1910.	1911.

CORN CROPS.

The total area under wheat, barley, and oats in 1911 was 6,514,639 acres, or 43,870 acres less than in 1910, though

greater than in 1909 and 1908. The favourable autumn of 1910 and the maintenance of a higher level of prices resulted in a considerable extension of the area sown with wheat, but this was more than balanced by the reduction of the area of barley, while oats also showed a slight decline.

The changes in the area returned under the three chief cereals in each part of Great Britain are shown in the following table, in which increases or decreases of area are indicated by the positive (+) or negative (-) sign:—

	Wheat.	Barley.	Oats.	Total of Three Crops.

Only in the eastern counties of England did the extension of the wheat area more than balance the losses under barley and oats, and in the east of Scotland the total area of the cereals was just maintained.

The total acreage of the **Wheat** crop in 1911 was 1,906,038 acres, or nearly 100,000 acres more than in 1910. This year's area is the greatest since 1899, when 2,000,000 acres were under wheat. Additions to the acreage were general throughout Great Britain, except in the west midland and south-western parts of England, and in Wales, where the autumn of 1910 was not so favourable to tillage as elsewhere. The most notable county increases were in Essex (19,000 acres) and Lincoln (nearly 17,000 acres).

The area under **Barley and Bere** (1,597,930 acres) is the smallest recorded since these returns have been collected, and 7·6 per cent. less than in 1910. The tendency to reduce the land under this crop was apparent in all parts of Great Britain. The most notable reduction was in Lincolnshire, where 24,500 acres (12 per cent.) were withdrawn from barley, while in Norfolk 13,000 acres, in Essex 11,000 acres, and in Suffolk 8,000 acres were lost. Considerable reductions took place in Scotland, about 2,800 acres (10 per cent.) being given up in Forfar, 2,700 acres (14 per cent.) in Fife, 2,000 acres in Perth,

and 1,600 acres in Aberdeen; reductions of over 1,000 acres were returned from Ross and Cromarty, Midlothian, and Haddington.

On the Agricultural Schedule of 1911 occupiers were asked to state separately their acreage of bere. It appears, however, that some uncertainty existed as to the meaning of the term south of the Tweed. In Scotland, however, where it is more generally understood, 9,400 acres were returned, and of this total Shetland and Orkney alone returned 5,300 acres. The other counties of Scotland from which the crop was principally returned were Aberdeen, 1,351 acres; Caithness, 740 acres; and Argyll, 313 acres.

The area under **Oats** was 3,010,671 acres, or slightly less than in 1910. The reductions of the acreage took place in the eastern counties (2,200 acres), the east midlands (7,400 acres), northern counties (5,500 acres), and north-western counties of England (15,500 acres), north Wales (176 acres), and the south-west of Scotland (2,000 acres); elsewhere additions were returned, the chief being 9,800 acres in the south-west of England and 6,500 acres in the north-east of Scotland.

Rye occupied a somewhat smaller area than in 1910, the total being 46,374 acres. Generally speaking, reductions occurred in England and Wales and a slight extension in Scotland.

The crop of **Beans** nearly regained the ground lost in 1910, and the total area of 311,833 acres was, with the exception of 1909, the largest since 1891. Extensions of area were general in England and Wales, except in the south-west, but very slight in Scotland. In Lincoln 8,000 acres were added, in Essex 6,600 acres, in Suffolk 3,400 acres, in Cambridge 2,250 acres, in Hertford and Northampton 2,000 acres, while in Huntingdon, Bedford, Norfolk, York (East Riding), and Kent the gain ranged from 1,900 to 1,000 acres. The total area of **Peas**, however, showed little alteration, though in some counties of England there were additions, including 1,800 acres in Lincoln, while in others reductions occurred, including 1,500 acres in Kent, 1,200 acres in Essex, and 1,000 acres in Suffolk.

The area of **Buckwheat** was 5,750 acres, or 753 acres more than in 1910. A further extension took place in Cambridgeshire, bringing the total area of the crop in that county to 2,129 acres.

POTATOES AND ROOT CROPS.

Only nine counties of Great Britain returned a reduced area of **Potatoes** in 1911; the total extent of the crop was 571,801 acres or 32,117 acres more than in 1910, the increase being attributed to higher prices and a favourable planting season. The total is only 3,500 acres less than in 1909 and, otherwise, the largest since 1905. Of the additional area, 25,700 acres were in England; 7,000 acres were added in Lincoln, 3,400

acres in Cambridge, 2,650 acres in the West Riding, and 1,000 acres in Essex and the North Riding respectively. In Scotland 5,800 acres were added, nearly all being in the eastern counties.

The area under **Turnips and Swedes** was 1,563,390 acres, being only slightly less than in 1910. A tendency to extend the acreage was shown in the eastern parts of England, but elsewhere in Great Britain there were reductions.

The **Mangold** area increased by 9,541 acres to 452,320 acres, this total having been only once before exceeded, in 1909. Greater breadths were planted in nearly every English county, the most notable extension being 1,707 acres in Norfolk, which thus recovered one-half of the area lost in 1910.

Hops.

The area planted with **Hops** showed a small increase (170 acres) over that returned in 1910, and the total acreage is now 33,056 acres. Some slight extension of acreage occurred in Kent, Sussex, Hampshire, and Hereford, but in the other hop-growing counties the tendency was towards reduction. The total area of 1911 is 5,900 acres less than in 1908 and 11,900 acres less than in 1907.

FRUIT CROPS.

The total area under small fruit and orchards remained practically the same as in 1910, and it would appear that for the time being the cultivation of fruit is stationary in this country, the maximum acreage devoted to fruit-growing having been reached in 1909.

The area returned as mainly devoted to each kind of fruit, in each of the last four years, is shown in the following table :—

	1911.	1910.	1909.	1908.
SMALL FRUIT :—	<i>Acres.</i>	<i>Acres.</i>	<i>Acres.</i>	<i>Acres.</i>
Strawberries - - - -	24,229	27,451	30,064	28,815
Raspberries - - - -	9,051	8,840	9,257	9,323
Currants and gooseberries - -	27,557	25,530	26,106	26,241
Other kinds (including mixed areas)	23,471	22,488	21,689	20,501
TOTAL - -	84,308	84,309	87,116	84,880
ORCHARDS :—				
Apples - - - - -	170,155	172,001	173,168	172,751
Pears - - - - -	9,420	9,636	9,475	9,604
Cherries - - - - -	12,005	11,597	11,474	11,868
Plums - - - - -	16,788	16,397	16,777	15,683
Other kinds (including mixed areas)	42,319	41,012	40,442	40,391
TOTAL - -	250,687	250,673	251,366	250,297

The reduction of the acreage returned as under strawberries by over 3,000 acres since 1910, and nearly 6,000 acres since 1909 is noteworthy. Raspberries appear to have regained half of the acreage lost in 1910, while currants and gooseberries have increased. The collectors generally note a tendency to substitute other fruit for strawberries, which appear at present to have reached the limit of profitable cultivation in this country.

The county figures show few alterations of note in the **Small Fruit** area as a whole. Extensions in Cambridge of 121 acres, in Norfolk of 186 acres, in Somerset of 117 acres, in Devon of 97 acres, and in Cornwall of 104 acres were recorded, but on the other hand 165 acres were lost in Middlesex, 287 acres in Kent, and 112 acres in Gloucester. The returns for **Orchards** show a tendency towards expansion of area in the eastern, north-eastern; and south-eastern divisions of England, which added 974 acres, 155 acres, and 1,283 acres respectively. In Kent the area of orchards increased by 1,220 acres, in Suffolk by 361 acres, and in Cambridge by 275 acres. In other districts of England the orchard area was reduced, especially in the south-west, where 1,118 acres were given up, mainly in Somerset and Devon; while 393 acres less were returned from Gloucester and 208 acres less from Lancashire. In Scotland and Wales small reductions of the acreage were general.

CLOVER AND ROTATION GRASSES.

The area devoted to Clover and Rotation Grasses was reduced in 1911 by 37,229 acres, and the total acreage for the year was 4,119,808 acres. The area has steadily declined since 1901, when 4,856,000 acres were returned, while, in 1898, the area was as large as 4,911,000 acres. The greatest reductions in 1911 took place in the eastern counties (20,000 acres, of which 6,800 acres were in Essex), north-eastern counties (9,400 acres, of which 7,800 acres were in Lincoln), and south-western counties (7,300 acres). Large decreases also took place in Northumberland (nearly 3,000 acres), Wiltshire, Cumberland, Hampshire, Berkshire, Buckingham, Hereford, Nottingham, and Northampton (ranging from 1,900 acres to 1,000 acres). In the north-western division there was, however, a net increase of over 10,000 acres, and in the south-eastern division a net increase of nearly 2,300 acres. In Wales and Scotland the tendency varied in different counties. An addition of 2,200 acres in Carnarvon was over-balanced by losses of 4,700 acres in Merioneth and 3,000 acres in Cardigan. Larger areas of rotation grasses were general in the north of Scotland, while 3,000 acres were added in Kirkcudbright and 1,000 acres in Selkirk. Otherwise the areas were smaller in the south and just balanced the increases in other parts of the country.

OTHER CROPS.

The area planted with **Cabbage** was 65,179 acres, the addition of 3,250 acres being a partial recovery of the area lost to the crop in 1910. Most counties in Great Britain returned a larger acreage, the more notable increases being 600 acres in Bedford, 462 acres in Hampshire, 372 acres in Devon, 288 acres in Kent, and 185 acres in Essex. In Suffolk 234 acres and in Warwick 146 acres were withdrawn from the crop.

The total area of **Kohl-rabi** declined by 1,550 acres to 13,330 acres. 1,000 acres were given up in the eastern counties, of which 463 acres were in Essex; the other reductions were chiefly in Lincoln, Kent, Hampshire, and Northampton. An addition of 254 acres occurred in Wiltshire.

The area of **Rape** also declined and the total of 78,573 acres was 3,149 acres less than in 1910. Slight net increases occurred in the eastern and north-western counties of England, North Wales, and the east of Scotland, but in Devon, where the area (9,842 acres) is greater than in any other county, the reduction since 1910 was 1,176 acres; considerable losses also occurred in Cornwall, Wiltshire, and Hampshire, where large areas are grown.

The total acreage returned for the three last-named green crops was 157,082 acres, being the smallest aggregate since 1895.

Vetches or **Tares** show a slightly increased area, the total of 110,543 acres being 5,939 acres more than in 1910. The additions were practically all in the eastern divisions of England. In Essex 1,356 acres were added. There were also small net increases in the west midlands of England and the north-west of Scotland, but elsewhere the acreage of the crops was somewhat smaller.

The acreage under **Lucerne** was reduced by an amount (5,365 acres) nearly equal to the increase of vetches and tares, the total area of the crop in 1911 being 53,140 acres. In the eastern division 3,585 acres were diverted to other purposes, 2,261 acres being in Essex. In the south-east the crop lost 1,029 acres and in the east midlands 764 acres; elsewhere the changes of acreage were quite small. The reduction of the lucerne area in 1911 followed a reduction of 6,822 acres in the preceding season.

The area devoted to **Carrots** increased from 10,724 acres to 11,248 acres, the acreage lost in 1910 being thus regained. Additions of 611 acres were made in Cambridge, 130 acres in Huntingdon, 119 acres in Lincoln, and 82 acres in the East Riding. In Bedford, however, 187 acres were relinquished, and small areas in many other counties, so that the net addition for the country as a whole was only 524 acres.

The area under **Onions** continues to increase, being, in 1911, 4,221 acres or 183 acres more than in 1910. The largest area in any one county was 1,017 acres in Bedford, Essex being next with 569 acres.

The cultivation of **Chicory** occupied 225 acres, or 11 acres more than in 1910.

Flax was returned more largely from nearly all counties where the crop is grown, the total area increasing from 229 to 449 acres.

The returns show a further extension of the cultivation of **Sugar Beet**, the acreage being 536 acres, or 30 acres more than in 1910. The details for counties show, however, that the crop has not made further headway in several counties in the east of England in which some progress was recorded last year, and it is rather in the south-east, east and west midlands, and south-west that new areas have been planted. In Suffolk the area has fallen from 102 to 93 acres, in Essex from 143 to 33 acres, in Lincoln from 52 to 6 acres, and in Hampshire from 16 to 6 acres. Collectors in Essex and Lincoln attribute the set-back to the abandonment of proposals for sugar beet factories and to unprofitable prices; in Suffolk also a Collector states that the crop proved unprofitable. The counties chiefly showing increased areas are Cambridge, Norfolk, Kent, and Worcester. The crop was returned from 38 counties in 1911, as compared with 28 in 1910, showing an increasing interest in the crop though apparently as yet its cultivation has been only tentatively undertaken.

BARE FALLOW.

The autumn and spring of 1910-11 were on the whole favourable to the working of the land and to this may be attributed the reduction of the area left as **Bare Fallow**. The total so returned was 329,402 acres or 24,608 acres (7 per cent.) less than in 1910. This total, however, is larger than in any other year since 1905. The detailed figures show reductions of 9,500 acres in the eastern counties (including 5,600 acres in Essex), 4,400 acres in the north-eastern, 2,300 in the south-eastern, 5,700 in the east midland, and 2,500 in the northern division. A small increase of bare fallow was returned from the south-west of England and in south Wales, and the reduction was only small in the west midlands and north Wales. The tendency varied in the east of Scotland, but in the west the area of bare fallow was generally smaller than in 1910.

PERMANENT GRASS.

For the first time since 1902 the returns show a reduction in the area of **Permanent Grass** land, the total for 1911, 17,446,870 acres, being 30,170 acres less than in 1910. The

reports received from the Collectors show that not infrequently an area returned as permanent grass last year has this year been classed by occupiers as mountain and heath land used for grazing, and the net addition of 31,434 acres to this category appears to be thus mainly accounted for. In some counties of England, however, the detailed figures indicate that land returned in the previous year as permanent grass has been brought under the plough. This appears to have taken place notably in the following counties, where the additions to the arable land are indicated in brackets:—Suffolk (2,300 acres), Sussex and Chester (2,000 acres each), Cambridge and Lancaster (1,800 acres each), Warwick (1,400 acres), Stafford (1,300 acres), Middlesex, Kent, and the East Riding (about 1,000 acres each). In the west midlands and south-west of England, on the other hand, the familiar extension of permanent grass at the expense of the arable land has continued, 16,380 acres being laid down to grass in these counties. In Scotland and Wales it is difficult to estimate the tendency of farming in this respect, owing to the absence of a clear distinction between permanent grass and mountain and heath grazing land, and also because, in some instances at least, rotation grasses, which lie for several years, are occasionally returned as permanent grass. After allowing for the latter possibility it would appear that some permanent grass has been brought under arable cultivation in the north-east of Scotland.

The area kept for hay was about 37,000 acres smaller than in 1910 in the north-eastern, eastern, and south-eastern counties, but elsewhere in Great Britain larger areas were reserved for mowing, though in individual counties, such as Nottingham, Leicester, Warwick, the West Riding, and some counties in north Wales and north-east Scotland, the hay area was smaller. Speaking generally, the area grazed increased in the north-east and east of England, but was smaller elsewhere.

Combining the mown area of permanent grass and of rotation grasses, the hay crop of 1911 was taken from 7,077,643 acres, or practically the same as in 1910. In the eastern counties of England the area was 43,000 acres less, in the north-eastern counties 19,700 acres less, and in the south-eastern and east midland counties 7,200 acres less; the hay area increased by 7,300 acres in the west midlands, 13,000 acres in the south-west, 5,800 acres in the north, and 11,200 acres in the north-west of England, by 4,200 acres in Wales, and 26,300 acres in Scotland.

HORSES.

In the report on the returns for 1907 attention was directed to the decline in horse-breeding, which was especially marked in that year. The decrease, in one year, of the number of "unbroken horses under one year" by over 10,000 was cited

as evidence of the serious depletion to which the stock of horses in this country was subject. This sudden reduction, in a single year, was, as was pointed out, partly due to seasonal causes, but it was mainly attributable to declining demand. After so great a decrease in a single year, the annual crop of foals (as represented by the unbroken horses under one year) was fairly well maintained at the level of 1907 for the three following years, but this year the returns show a further reduction, which must be taken as another sign of the decreased demand for horses. The number of unbroken horses under one year in each of the past seven years has been returned as under:—

Year.	England.	Wales.	Scotland.	Great Britain.
1905	102,048	23,331	14,302	139,681
1906	99,918	22,604	14,419	136,941
1907	90,835	22,185	13,470	126,490
1908	91,014	23,150	13,374	126,538
1909	90,424	22,048	13,850	126,322
1910	91,451	21,104	13,625	126,180
1911	87,053	20,367	13,427	120,847

The reduction in 1911 was 5,333, or 4·2 per cent., while, compared with the maximum of 1905, the annual foal crop is reduced by nearly 19,000 or 13·5 per cent. These figures clearly suggest a declining demand for horses. The restriction of the home market by reason of the rapid substitution of motors for horses has not been counterbalanced by any extension of the demand from abroad, which for many years has provided a stimulus to the breeding of good horses in this country.

The attention which has been recently directed to the reduced demand for horses, and the consequent restriction of horse-breeding, has led to demands for more statistical information on the subject. In the schedule for 1911 occupiers were accordingly requested to supply further details of the horses on their holdings. They were asked to state the number of stallions above two years old, used or intended to be used for service, distinguishing "light" and "heavy" horses; and they were further asked to return the number of horses on their holdings other than those used for agricultural purposes, mares kept for breeding, and unbroken horses to which the returns had previously been restricted. In any alteration made in a long-standing form of return some risk of misapprehension must arise, and it is usually discreet to wait until the new form has become familiar before accepting the results with too great confidence.

There is little doubt that as a rule stallions above two years old, used or intended to be used for service, were previously included in the returns among the unbroken horses one year and above, and it is quite possible, and indeed likely, that in some

schedules this year they may have been again included under the old heading instead of being entered in the new class. For that reason I am inclined to think that the number of such stallions is probably under-stated, and I should prefer to wait for another year's returns before making any comments on the number so returned.

The proportion of light and heavy stallions, respectively, may perhaps be accepted, bearing in mind that ponies are included in the returns, and also remembering that the line dividing the two classes is not in some cases very clearly defined. The proportions are as follows:—

Class.	England.	Wales.	Scotland.	Great Britain.
	Per Cent.	Per Cent.	Per Cent.	Per Cent.
Light - -	45·8	59·2	42·2	47·3
Heavy - -	54·7	40·8	57·8	52·7

It may be noted that in the eastern division of England the proportion of heavy stallions was 66 per cent., while in the south-west it was 47 per cent., and in the south-east and north 42 per cent.

The number of "other" horses returned was 146,818. Properly speaking, these, comprising horses used for pleasure, hunters, &c., not employed on the farm, had previously been excluded, but, in this case also, I have some doubt. The definition "horses used for agricultural purposes," though clear enough in most instances, is evidently capable of different interpretation in the case, for instance, of a pleasure horse which is occasionally used for carting or other light work for the farm. It may well be, therefore, that the provision of a separate class for other horses has led some occupiers who had formerly entered all their horses under the old heading to classify them more correctly. This appears probable from the unusually large reduction, 49,861, in the number returned as used for agricultural purposes. Probably some of these now appear as "others," and the apparent reduction partly represents a transference from one class to the other and not an actual loss.

But, at any rate, the present returns show, for the first time, the total number of horses of all kinds on the farms of the country—the aggregate being 1,627,393. Horses in towns, or not kept on agricultural holdings are, of course, still outside the scope of these returns.

CATTLE.

The total number of **Cattle** returned in 1911 was 7,114,264, being an increase of 76,937 or 1·1 per cent. This is the largest number yet recorded and makes an addition of over

200,000 during the past three years. The increase on the year in England was 47,725 and in Scotland 29,258; no change occurring in Wales. In England additions were recorded in the south-east, east and west midlands, south-west, and north; and decreases in the east, north-east, and north-west.

An increase of 57,431 was recorded in the number of cows and heifers in milk or in calf, those returned as in milk at the time of the returns increasing by 4,006 and those in calf, but not in milk, by 53,425.

This is now the fifth year in which the cows and heifers in milk and in calf respectively have been separately returned. For the first three years the proportion between the two classes was much the same, slightly over 20 per cent. of the total being returned as in calf but not in milk at the date of the returns. In 1910 the proportion fell to 19·60 per cent. and in 1911 it rose to slightly over 21 per cent. It does not appear, however, that these changes can be regarded as significant.

The increase of the milking herd as a whole is satisfactory as repairing the loss to which I called special attention last year and bringing the total up to the largest yet recorded. The number is now 2,825,049 or 88 per 1,000 acres of cultivated land as compared with 80 per 1,000 acres 10 years ago and 70 per 1,000 acres thirty years ago. This may be said, in some degree, to measure the increasing importance of dairying as a branch of agriculture.

The largest additions to the dairy herd in 1911 were in the north-west and west midlands, south-east and east midlands, and south-west of England, though all other divisions of Great Britain, except the south-east and north-west of Scotland, contributed.

Among the three classes (under one year, one year and under two, and two years and above) into which "other cattle" are divided, an increase of 40,850 in those of two years and above follows upon a similar increase in the class one year and under two in 1910 and the large increase of calves recorded in 1909. More than one-half of the addition is found in the north-east of Scotland, 8,000 being in Aberdeen, 4,700 in Forfar, 3,000 in Kincardine, 1,800 in Fife, and 1,500 in Perth. The Collectors in that division mention large supplies of turnips during the winter of 1910-11 as a reason for the increased stock of older cattle. The largest increases in England were in the south-western counties (6,600), northern counties (4,800), west midlands (4,100), south-eastern counties (3,200), Lincoln and the East Riding (3,500). In Norfolk, however, the number fell off by 8,600, and the north-western counties also showed smaller numbers.

The number of "other cattle, one year and under two" was 33,600 less in 1911, following upon a similar decrease of calves in 1910. The shortage is greatest in the north-west, west midlands, east and north-east of England, and in Wales.

The returns of "other cattle, under one year" show an addition of over 12,000 to their number. This increase is relatively small (0·9 per cent.) and indicates no material addition to the number of calves reared. The increase shown this year does not make good the decline of nearly 39,000 in the number of cattle under one year returned in 1910. Scotland is responsible for 5,900 of the addition and Wales for 2,100, but in England many counties returned smaller numbers, the most important being Somerset with 1,700 less. Lincoln, however, returned 2,000 more, Salop 2,400, and Lancaster 1,000 more.

SHEEP.

The total number of **Sheep** returned in 1911 showed a further falling off from the high figure of 27,618,419 reached in 1909, the number for the present year, 26,494,992, being 607,953 (2·2 per cent.) less than in 1910 and 1,123,427 less than in 1909. The loss was in England and Wales, Scotland returning nearly 20,000 more than in 1910.

The returns for the several classes show a serious reduction of the number of ewes kept for breeding; the decrease of 222,000 (2·1 per cent.) follows upon one of 145,000 in 1910, making the total reduction 367,000 since 1909. The total number of ewes (10,443,488) is smaller also than in 1908, but larger than in any year from 1900 to 1907, inclusive. The diminutions in the breeding flocks in 1911 were greatest in England and least in Scotland; in the west midlands the numbers declined by 38,000 (of which over 10,000 were in Gloucester); in the eastern counties by 34,000 (over 10,000 being in Essex); in the south-east by 30,000 (over 11,000 being in Kent); in the east midlands by 29,000; in the south-west by 18,000 (over 10,000 being in Somerset); in the northern counties by 14,000, and in the north-west by nearly 6,000. In Norfolk the reduction amounted to over 11,000 ewes, but gains and losses of nearly 4,000 balanced in Lincoln and the East Riding. Of the reductions in Wales over 24,000 were in the southern counties, and the net loss was small in the northern counties. In a number of counties in the west and extreme north of Scotland the ewe flock increased, and the reductions were in the extreme south-west and in the eastern counties.

The reductions of the number of ewes are attributed by many of the collectors to the drought prevailing in the late spring, which made the outlook for keep unfavourable, and the competing pressure of increased numbers of cattle upon the pastures available.

The number of lambs ("sheep, under one year") returned in 1911 was 10,550,630, or nearly 400,000 (3·6 per cent.) less than in 1910. The decreased numbers were mainly in England and Wales, most of the Scottish counties, particularly in the

west, returning larger numbers. In England the eastern counties, including Norfolk, the south-eastern, and east midland counties showed the largest relative reductions. In Kent over 43,000 (11½ per cent.) fewer lambs were returned.

The number of sheep of one year and above was returned as 5,500,874 in 1911, as compared with 5,487,317 in 1910 and 5,860,907 in 1909.

Pigs.

The number of **Pigs** returned in 1911 was 2,822,154, being 472,208 (20·1 per cent.) more than in 1910, and again reaching the level of 1908. One county only, Shetland, failed to return larger numbers in 1911, and the additions to the stock in the several divisions of Great Britain were as follows:—England, east, 64,000 (17 per cent.); north-east, 56,000 (20 per cent.); south-east, 28,000 (14 per cent.); east midland, 27,000 (16 per cent.); west midland, 53,000 (20 per cent.); south-west, 64,000 (18 per cent.); north, 50,000 (30 per cent.); north-west, 52,000 (22 per cent.); Wales, 40,000 (20 per cent.); Scotland, east, 21,000 (35 per cent.); west, 17,000 (23 per cent.).

Every county of Great Britain except London returned larger numbers of breeding sows. The total number for 1911 was 397,789, being 66,311 (20 per cent.) greater than in 1910 and over 81,000 more than in 1909. The total is also the highest recorded since 1895, when 415,210 breeding sows were returned. The year's increases were relatively greatest in the northern counties of England (24 per cent.); north-western counties (29 per cent.); Wales (25 per cent.); Scotland, south-west (40 per cent.), and north-east (37 per cent.). The additions were relatively smallest in south-east England (13 per cent.).

GAINS AND LOSSES OF LIVE STOCK.

The changes in the number of each class of live stock between the two enumerations of June 1910 and 1911 are summarised in the following table:—

GAINS.		LOSSES.	
	No.		No.
CATTLE :—		HORSES :—	
Cows and heifers in milk -	4,006	Unbroken, under 1 year -	5,333
" " in calf -	53,425		
Other cattle, 2 years and above.	40,850		
Cattle, under 1 year -	12,259	CATTLE :—	
		Other cattle, 1 year and under 2.	33,603
SHEEP :—			
Other sheep, year and above.	13,537		
PIGS :—		SHEEP :—	
Sows for breeding -	66,311	Ewes, for breeding -	222,156
Other pigs -	405,897	Other sheep, under 1 year -	399,354

I have refrained from any attempt to balance the loss or gain in any class of horses other than those under one year, owing to the alteration in the classification. There can be no question that the decrease of the young horses is of serious import. The cattle figures are distinctly favourable, while the increase of breeding sows, it is to be hoped, may augur a permanent extension of pig-keeping, which has of late years failed so markedly to keep pace with the increased demand. Sheep-breeding appears for the time to be declining, but the high level reached in 1909 was perhaps somewhat exceptional, and the loss of ewes may have been due more to seasonal causes than to deliberate reduction. The increase of cattle-breeding, and especially of dairying, may, perhaps, in some cases, involve the abandonment or reduction of sheep-breeding, but there is as yet room enough for the extension of both on the land of Great Britain.

I have the honour to be, Sir,

Your obedient servant,

3, St. James's Square, S.W.,
14th November 1911.

R. H. REW.

Section I.

ACREAGE

AND

LIVE STOCK.

TABLE 1.—ACREAGE UNDER CROPS and GRASS; and NUMBER of LIVE STOCK on the 5th June, 1911 and the 4th June, 1910, in GREAT BRITAIN, with the AVERAGE of the TEN YEARS 1901—1910, the INCREASE or DECREASE in 1911, as compared with 1910, and the DIFFERENCE from the TEN YEARS' AVERAGE.

† The apparent changes in the area under grass in Ireland in 1906 as compared with 1905 are largely due to greater care in classification, and to the transfer of some grass land from one category to another, or to a new item, "Grass Mountain Land."

Notes to Table 26.

(a) These figures refer to "lands," whether cultivated or uncultivated, including ornamental grounds, gardens attached to houses when exceeding one acre in extent, tithe-rent charge commuted under the Tithe Commutation Acts, farm-houses and farm-buildings.

(b) The rateable value of "lands" according to the Union Assessment Lists was ascertained for each county in England and Wales in 1870, 1894, and 1899, and the above figures are given in H.L. 150 of 1900. "Lands" include "agricultural lands" as defined in section 9 of the Agricultural Rates Act, 1896; and also other lands, farm-houses and farm-buildings, tithe-rent charges and uncommuted tithes, but excluding lands occupied as railways, canals, &c.

Note to Table 27.

(c) "Agricultural land" as defined by section 9 of the Agricultural Rates Act means any land used as arable, meadow or pasture land only, cottage gardens exceeding one quarter of an acre, market gardens, nursery grounds, orchards or allotments, but does not include land occupied together with a house as a park, gardens other than aforesaid, pleasure grounds or any land preserved mainly or exclusively for purposes of sport or recreation. It is exclusive of farm-houses and farm-buildings, tithe-rent charges and uncommuted tithes.

AGRICULTURAL STATISTICS OF GREAT BRITAIN.

The annual AGRICULTURAL STATISTICS for 1910 are issued in four parts, as follows:—

Part I. (Cd. 5585, price 5½d.).

Report.

Tables: Section I.—Area under Crops and Live Stock.

" " II.—Value of Land.

Part II. (Cd. 5604, price 5d.).

Report.

Tables: Section III.—Produce of Crops.

" " IV.—Weather Statistics.

Part III. (Cd. 5786, price 3d.).

Report.

Tables: Section V.—Prices of Corn and Bread.

" " VI.—Prices of Live Stock and other
Agricultural Produce.

" " VII.—Supply of Live Stock at Markets.

" " VIII.—Trade in Live Stock with Ireland.

" " IX.—Imports of Agricultural Produce.

" " X.—Exports of Agricultural Produce.

Part IV., Foreign and Colonial Statistics. (*In the press.*)

NOTE.—These publications may be purchased (either directly or through a bookseller) only from the agents mentioned on the title-page.

BOARD OF AGRICULTURE AND FISHERIES.

AGRICULTURAL STATISTICS,

1911.

PART II.

REPORT.

To the Secretary of the Board of Agriculture and Fisheries.

SIR,

I BEG to submit Part II. of the Agricultural Statistics for 1911, containing returns of the yield of crops in Great Britain, compiled from the estimates furnished by the Board's Crop Reporters. The returns for Ireland, included in Table 27 so as to present the complete information for the United Kingdom, are supplied by the Department of Agriculture and Technical Instruction for Ireland. The statistics of rainfall, temperature, and bright sunshine, compiled from the reports of the Meteorological Office, are shown for the year ending September 30th instead of, as previously, for the calendar year. By the adoption of this period it seems to me that the records have a closer relation to the figures for the crops.

Preliminary statements showing the estimated average yield per acre and total production of the various crops were issued for Hops on the 12th October; for Corn, Pulse, and Hay on the 3rd November; and for Potatoes and Roots on the 29th November.

THE YEAR'S WEATHER.

The "farm year,"—October 1910 to September 1911—will be remembered mainly for its abnormally hot and dry summer, which exercised a marked influence upon all crops, and especially upon the yield of such crops as hay and roots.

Considering the weather during the entire twelve months, details of which will be found in Tables 42-44, it may be noted that rainfall was deficient by nearly 3 inches, or nearly 10 per cent., in England, by nearly 8 per cent. in Wales, and

by some 5 inches, or 13 per cent., in Scotland; that the mean temperature exceeded the average by about $1\frac{1}{2}^{\circ}$ in England, but more moderately in Wales and Scotland. Bright sunshine was some 230 hours, or 15 per cent., above the average in England and Wales, and about 150 hours, or 12 per cent., above in Scotland. As these conditions were most accentuated during the summer months, and were then more marked in England, especially in the midland and eastern counties, the drought and heat were more severely felt, and their effect on the crops was much greater in this portion of the kingdom than in Scotland or Wales.

October 1910 had generally an average rainfall, with a temperature much above the normal. Good progress was made with autumn work during this period, and a considerable area of wheat was sown under good conditions. Both November and December were wet, but while the former month was also very cold, the latter was very warm. The frosts and rains greatly hindered autumn work, and the later wheat consequently did not go into anything like such a good seed-bed as the earlier sown. Severe floods in many parts of England during December did considerable damage to the young wheat. The first four months of the year did not differ very materially from the normal (though January was dry and there was a cold spell at the beginning of April), but with May an excessively hot, dry period set in, which lasted, with only a short break at the end of June and beginning of July, until the middle of September. The rainfall of May was, perhaps, 70 per cent. of the average in England; and the dry weather continued into June, so that the rains towards the end of that month, though of great value to all other crops, were too late for the hay. As a result of these rains, the drought and temperature of June, although above average, were not excessive. It was the drought of the following three months which exercised such deleterious effects on crops, especially turnips and swedes, and pastures, while live stock also suffered. The rainfall in England during July was less than 20 per cent. of the average, while temperature was $3\frac{1}{2}^{\circ}$ above normal. The next month proved the hottest August on record, the temperature over England being quite 5° above average, while rainfall was about 60 per cent. of the mean. After a very hot period of ten days the weather became cooler about the middle of September, and the average temperature for this month was only about 2° above the mean, while the total rainfall was also nearer the normal.

DURATION OF HARVEST.

The returns made by the Board's Crop Reporters of the earliest date of the first cutting of corn in their districts are summarised in the following table for each division of Great Britain. In supplying this information the Reporters are

instructed to ignore exceptional cases of small areas on which cutting began at even an earlier date.

AGRICULTURAL DIVISIONS.	WHEAT.	BARLEY.	OATS.
	<i>Earliest Date.</i>	<i>Earliest Date.</i>	<i>Earliest Date.</i>
ENGLAND:—			
I.—E. and N.E. -	10 July	10 July	10 July
II.—S.E. and E. -			
Midland -	10 July	14 July	10 July
III.—W. Midland and S.W. -	17 July	18 July	6 July
IV.—N. and N.W. -	24 July	20 July	15 July
WALES -	15 July	15 July	15 July
SCOTLAND -	1 August	1 August	1 August

The earliest date of harvesting wheat was returned from Hertford, Middlesex and Sussex. The same date was returned for barley also from the first two of those counties. The oat harvest began earlier; the 6th July was returned from Devonshire, while the 10th was returned from several counties. The commencement was very much earlier than in 1910 throughout Great Britain, and also distinctly earlier than in 1909 in England, though not so markedly in Wales and Scotland.

Harvesting became general within about a fortnight after the dates above recorded. The average dates of the commencement and finish of the cereal harvest are shown in the following table:—

AGRICULTURAL DIVISIONS.	WHEAT.		BARLEY.		OATS.	
	Average Commencement.	Average Finish.	Average Commencement.	Average Finish.	Average Commencement.	Average Finish.
ENGLAND:—						
I. -	25 July	25 Aug.	29 July	27 Aug.	25 July	25 Aug.
II. -	26 July	22 Aug.	29 July	22 Aug.	23 July	21 Aug.
III. -	25 July	18 Aug.	28 July	30 Aug.	25 July	20 Aug.
IV. -	4 Aug.	30 Aug.	4 Aug.	30 Aug.	31 July	31 Aug.
ENGLAND -	28 July	24 Aug.	30 July	25 Aug.	26 July	25 Aug.
WALES -	2 Aug.	28 Aug.	3 Aug.	29 Aug.	3 Aug.	1 Sept.
SCOTLAND -	11 Aug.	10 Sept.	12 Aug.	12 Sept.	14 Aug.	17 Sept.
GREAT BRITAIN -	2 Aug.	29 Aug.	3 Aug.	31 Aug.	2 Aug.	1 Sept.

In the east and north of England the corn harvest was about 19 days earlier than in 1910, but in the south and west and in Wales the difference was a few days less. In Scotland, the oat and barley harvests were about 14 days earlier, and the wheat harvest 23 days earlier.

These means are by far the earliest since these returns were first analysed six years ago. 1911 is the first year (of the six) for which the average date of commencement for the whole of England has been calculated to have occurred in July, and the

first for which the average date of termination has been in August, while equally advanced dates may be recorded for Wales and Scotland. The following summary which shows the average dates of the beginning and end of harvest in 1906-11, is of interest.

—	Year.	WHEAT.		BARLEY.		OATS.

A most notable feature of the harvest of 1911 was its rapid progress and completion, which is exhibited in the following table, in which the average duration of the harvest is compared with that of the five previous seasons.

—	YEAR.	WHEAT.	BARLEY.	OATS.

	1911	28	29	31

In Great Britain, as a whole, the average period during which harvest operations continued in a Reporter's district extended to just four weeks in the case of wheat, a day more in the case of barley, and three days more with oats. The harvest was generally the shortest in any of the six years for which these data are available.

THE HARVEST OF 1911.

The shortness of the time during which harvesting operations extended was due, in the main, to the unbroken continuance of fine weather, though to some extent it may have been attributable to the deficient bulk of the crops. In the country as a whole the corn crops, at any rate, turned out in the end more satisfactorily than was commonly anticipated though there was great diversity between the results in different districts—the influence of soil and farming, as well as, in some localities, of brief storms, being strongly marked. Wheat, as usual in a season of drought, came out best of the cereals, the yield for Great Britain as a whole being put at 4 per cent. above average, or slightly better than had been forecasted by the Board's Crop Reporters. Barley and oats were each returned at 5 per cent. below average, the former being a little worse and the latter a little better than anticipated. Beans with a deficiency of 17 per cent. were much worse than forecasted, but peas were only 3 per cent. below average. The potato crop, of which anticipations were at one time rather gloomy, was returned after all at 10 per cent. above average, the results in the great potato-growing districts being generally favourable. Roots and hay naturally suffered most from the drought, and, in many districts, turnips and swedes were an almost complete failure, while many meadows intended for hay were not worth the mowing. But even with these crops there were comparatively favoured districts, and for the country as a whole the crops of turnips and swedes and of meadow hay were returned in the end at about three-fourths of an average. Mangolds were appreciably better than turnips and swedes, and better hay crops were obtained from arable land than from permanent grass—both mangolds and clover hay being put at about 17 per cent. below average. Hops were the best crop of the year with a return of 11 per cent. over average.

The relation of the year's crops to the average and also to the highest and lowest returns previously recorded is shown in the following table:—

CROPS.	Yield in 1911.	Average 1901- 1910.	Previous Records.			
			Highest.		Lowest.

Hops - - - -	9·92	8·96	14·21	1905	4·81	1888

It will be noticed that for each crop there have been higher and lower records, but it would be necessary to go back to the early "nineties" to find a year in which there was so general a deficiency all round.

WEIGHT OF GRAIN CROPS.

The returns of the crops which are presented in the subsequent tables are of course purely quantitative. The figures give no information as to quality or condition, and, as has not infrequently happened, they may show a favourable result as regards bulk which has to be discounted considerably in calculating the value of the recorded yield, by reason of inferior quality or indifferent condition. In 1911, however, it may be said generally that some compensation for shortness of yield was afforded by the excellence of the quality and condition. Of the latter the favourable weather at harvest may be assumed to give some indication, while, as regards quality, the estimates which are furnished of the natural weight per bushel of the three chief crops afford satisfactory evidence.

The following table shows for each of the main divisions the average weight per bushel of wheat, barley and oats respectively, in 1910 and 1911.

AGRICULTURAL DIVISIONS.	WHEAT.		BARLEY.		OATS.	
	1911.	1910.	1911.	1910.	1911.	1910.
ENGLAND:—	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.
I.—E. and N.E. -	63·7	61·5	55·8	52·9	41·3	39·5
II.—S.E. and E. Mid- land.	63·3	61·6	55·0	53·0	39·6	38·7
III.—W. Midland and S.W.	64·0	60·7	55·3	53·5	39·1	38·7
IV.—N. and N.W. -	62·7	61·4	55·2	53·4	40·7	41·0
ENGLAND - - -	63·6	61·3	55·4	53·2	40·3	39·4
WALES - - -	60·9	60·3	51·8	52·7	38·6	39·1
SCOTLAND - - -	62·9	61·2	55·9	53·0	41·5	40·6
GREAT BRITAIN - - -	63·5	61·3	55·3	53·1	40·6	39·8

The superiority of the wheat and barley crops of 1911 over those of 1910 is very marked in England and Scotland but the returns for Wales are less satisfactory. The superiority was however less marked in the north and north-west of England than in more southern counties. In the case of wheat, the west midland and south western division showed the best results, averaging 3·3 lbs. per bushel more than in 1910. As regards barley, Scotland and the east and north-east of England gave the heaviest crops, which averaged 2·9 lbs. per bushel more than in 1910. The oat crop in the east and north-east of England averaged 1·8 lbs. per bushel more than in 1910; but elsewhere the difference was not so large, while in the north and north-west of England and in Wales, the weight per bushel was actually inferior to that of 1910.

The following table gives a comparison of the returns for the three countries in each of the six years for which estimates of the natural weight of grain have been analysed:—

Year.	England.			Wales.			Scotland.		
	Wheat.	Barley.	Oats.	Wheat.	Barley.	Oats.	Wheat.	Barley.	Oats.
	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.	Lbs.
1906	63·0	54·7	40·8	60·8	52·8	39·6	61·7	53·6	41·1
1907	61·7	53·8	40·2	60·0	50·3	39·2	59·6	50·5	39·3
1908	61·9	53·7	39·4	60·4	51·7	38·2	60·8	52·9	40·5
1909	61·0	53·1	38·9	60·0	50·9	38·6	61·1	53·5	40·7
1910	61·3	53·2	39·4	60·3	52·7	39·1	61·2	53·0	40·6
1911	63·6	55·4	40·3	60·9	51·8	38·6	62·9	55·9	41·5

The year 1911 was thus the best of the six years for wheat and barley in England; for wheat in Wales; and for all three crops in Scotland.

Some misapprehension occasionally arises as to the precise significance of the quarters and bushels in which the estimated production of the corn crops is shown in these returns. The practice has now become so general of using the word "quarter" or "bushel" to denote a specified weight of grain that it appears sometimes to be overlooked that the terms by themselves denote measure only. Ever since the annual produce returns were first collected—in 1884^o—the estimates have been made by Imperial measure. To convert the estimates into terms of weight it is of course necessary to know the natural weight of the grain to which the estimates refer, and this information is now furnished by the estimates of average weight per bushel which have been published during the past six years.

In the following table the estimated production by measure of wheat, barley, and oats in each of the past six years is shown with the estimated average natural weight per bushel of each crop and the equivalent, in weight, of the total produce.

YEAR.	WHEAT.			BARLEY.			OATS.		
	Total Produce.	Average Natural weight per bushel.	Total Weight.	Total Produce.	Average Natural weight per bushel.	Total Weight.	Total Produce.	Average Natural weight per bushel.	Total Weight.

HYPOTHETICAL VALUE OF CROPS.

Following the practice which I have adopted in recent Reports, the whole of the corn, potato, and hay crops have been valued at the market prices prevailing after harvest. For the present year the prices taken are the average for the three months, September–November, and the figures for the previous year have been calculated on the same basis. This year hops have been added. The prices for corn are those returned under

the Corn Returns Act and those for the other crops are compiled from the Board's weekly return of market prices.

CROP.	1911.			1910.		
	Total Produce.	Price.	Total Value.	Total Produce.	Price.	Total Value.
	Qrs.	per Qr. s. d.	£	Qrs.	per Qr. s. d.	£
Wheat - - -	7,882,171	32 7	12,760,000	6,859,656	30 5	10,432,000
Barley - - -	6,373,575	30 10	9,826,000	7,059,013	24 7	8,677,000
Oats - - -	14,294,107	19 8	14,056,000	15,228,625	16 4	12,487,000
	Tons.	per Ton.		Tons.	per Ton.	
Potatoes - - -	3,825,812	71 0	13,580,000	3,477,139	61 6	10,692,000
Clover, &c. Hay -	2,612,532	101 0	13,194,000	3,204,338	81 6	13,302,000
Meadow Hay -	4,569,372	97 6	22,276,000	6,252,292	70 6	22,059,000
	Cwts.	per Cwt.		Cwts.	per Cwt.	
Hops - - -	328,023	209 0	3,428,000	302,675	105 0	1,589,000

It will be seen that on the basis of value a comparison of the crops of 1911 with those of 1910 is much more favourable than on the basis of quantity, owing to the enhanced prices. Unfortunately, from the grower's point of view, the values are only partially realised, as a large proportion, especially of the oats and hay crops, is consumed on the farm. In the case of hops, however, which are all marketed, the difference of value is particularly marked, while wheat and potatoes, which are mainly sold, and barley, which is largely sold, all show a much better return by value than by quantity.

YIELD OF STRAW.

The estimates of the average yield of straw per acre, supplied by the Crop Reporters, are summarised in the following table. It will be observed that the deficiency of the yield, as compared with 1910, was greatest in the case of oats:—

AGRICULTURAL DIVISIONS.	WHEAT STRAW.		BARLEY STRAW.		OAT STRAW.	
	1911.	1910.	1911.	1910.	1911.	1910.
ENGLAND:—	Cwts.	Cwts.	Cwts.	Cwts.	Cwts.	Cwts.
I.—E. and N.E. - -	22	25	17	20	18	23
II.—S.E. and E. Midland	23	25	16	20	18	21
III.—W. Midland and S.W.	21	24	15	19	17	22
IV.—N. and N.W. - -	26	28	20	23	20	25
ENGLAND - - -	23	25	17	20	18	23
WALES - - -	22	24	17	19	18	24
SCOTLAND - - -	31	33	22	24	22	25
GREAT BRITAIN - -	23	25	18	20	19	23

Comparison with the returns annually obtained since 1906, shows that in 1911 the yield of straw was lighter in Great Britain as a whole than in any other year. The heaviest yields of the six years were obtained in 1907, when wheat straw was 6 cwts. per acre, barley straw 5 cwts. per acre, and oat straw 8 cwts. per acre heavier than in the past season.

The total production of wheat straw in 1911 may be estimated as 2,175,000 tons, as compared with 2,277,000 tons in 1910; of barley straw, as 1,405,000 tons, as compared with 1,761,000 tons; and of oat straw, as 2,912,000 tons, as compared with 3,521,000 tons.

CORN CROPS.

The estimated yield of the **Wheat** crop in 1911 was $32\frac{1}{2}$ bushels per acre as compared with the decennial average yield of $31\frac{1}{2}$ bushels. The total production was 7,832,000 quarters, or 973,000 quarters more than in 1910, when the yield per acre was only $30\frac{1}{2}$ bushels and the area planted with wheat was nearly 100,000 acres less. The crop was also the largest since 1899, when over 8,000,000 quarters of wheat were harvested. Heavier yields than usual were obtained in most counties, only 9 in England and 2 in Scotland returning lighter crops. In Wales the crops, though satisfactory on the whole, varied very much in different counties. In England the yields were better than usual over the large areas in the eastern divisions, and particularly so on the smaller areas of the south-western and northern divisions. Many very heavy crops were harvested in Scotland, where the total area planted was only 63,500 acres; on 10,700 acres in Forfarshire the yield was $3\frac{1}{2}$ bushels above an average: on 7,000 acres in Perthshire the excess was $4\frac{1}{2}$ bushels, while on 2,200 acres in Ross-shire the yield of $42\frac{2}{3}$ bushels was nearly 11 bushels per acre above an average.

The **Barley** crop amounted to 6,374,000 quarters, and was the smallest on record. The yield per acre was just under 32 bushels or $1\frac{1}{2}$ bushels under average. The deficiency in the yield was greatest in the eastern, midland, and north-western parts of England. In Cambridge and Hertford the shortage was 4 bushels per acre, in Suffolk and Kent 3 bushels, in Norfolk $2\frac{2}{3}$ bushels, in Oxford $4\frac{1}{2}$ bushels, in Gloucester over $5\frac{1}{2}$ bushels, in Salop nearly $6\frac{1}{2}$ bushels, while smaller areas in Warwick and Stafford were $7\frac{1}{2}$ bushels below an average crop. A few English counties had heavier crops than usual, the more notable being the East and West Ridings of Yorkshire, Somerset, Devon, and Northumberland. In Scotland the average yield was better than usual by half a bushel, though the western counties fared much better than those in the east, and on the large area in Forfarshire the crop was $2\frac{1}{2}$ bushels below an average, and in Berwickshire the deficiency was $1\frac{1}{2}$ bushels per acre.

It has already been explained in Part I. of the present volume (Cd. 6021, p. 12), that returns were obtained in 1911 of the acreage of bere as distinct from barley, with which it has been hitherto joined. The results of the attempted separation were not entirely satisfactory in consequence apparently of the fact that the term bere was unfamiliar to occupiers in some districts. This element of confusion was, however, not likely to arise in Scotland where bere is at any rate well known in connection with the striking of Fairs Prices. In Scotland the estimated average yield of bere was $32\frac{1}{2}$ bushels per acre, and the total crop amounted to 37,850 quarters. About two-thirds of the whole quantity was grown in Orkney, Shetland, Caithness, Sutherland, Inverness, and Ross, the average yield for this group of counties being slightly under 31 bushels per acre. In the north-eastern counties—where nearly one-fifth of the crop is grown (mostly in Aberdeenshire)—the average yield was rather more than $34\frac{1}{2}$ bushels, and in the south-eastern counties the average was $41\frac{1}{2}$ bushels per acre. Except in Argyll and Lanark there is little bere grown in the south-western counties, where the average yield per acre was slightly over 34 bushels.

The yield of **Oats** was more than 2 bushels per acre below average, and the total crop of 14,294,000 quarters was the smallest recorded since 1901. In England the yield was 3 bushels per acre under average, but in Scotland only $\frac{1}{2}$ bushel short. Better crops than usual were returned from 9 English counties. The greatest deficiencies were in the north-western, west midland, eastern, south-eastern, and north-eastern divisions, the shortage reaching over 7 bushels per acre in Salop, Worcester, and Cumberland and over 8 bushels per acre in Sussex. The deficiency was greater in North Wales than in South Wales, and the general yield was $1\frac{1}{2}$ bushels short. In Scotland the yield was light in the south-eastern and central eastern counties and in some important western counties, but better results than usual were obtained in the north-east and most western counties.

The total production (960,000 quarters) and yield per acre ($25\frac{1}{2}$ bushels) of **Beans** were the lowest since 1904. The yields were worst in the north-eastern, west midland, south-western and north-western divisions of England where they were from $5\frac{1}{2}$ to $8\frac{1}{2}$ bushels below the ten year average. In nine English counties the deficiency exceeded 9 bushels per acre. Returns were also very low in the east of Scotland, but better than usual in the chief bean producing counties in the west.

The yield of **Peas**, $26\frac{1}{2}$ bushels per acre was $\frac{2}{3}$ bushel below the average of the previous ten years, and the total production was the smallest returned since produce statistics have been collected, the deficiency being, however, partly due to the smaller area cropped. On the large area in Suffolk the yield was $\frac{2}{3}$ bushel above average, and in Nottingham the yield was $3\frac{3}{4}$ bushels above average, but only six other counties in England returned over-average crops. Essex returned 3 bushels

per acre less than the average; in Norfolk the deficiency was $3\frac{1}{2}$ bushels per acre and in Kent $2\frac{3}{4}$ bushels, but the poorest yields were returned on the small acreage of the west midland counties.

HAY CROP.

The yield of **Hay**, both from clovers and seeds and from permanent grass, was very light in 1911. The production of clover-hay per acre was 16·4 per cent., and that of meadow-hay as much as 23·3 per cent. below average. The yield per acre of clover-hay was the smallest since 1896, and of meadow-hay the smallest since 1901. For both crops the deficiency was greatest in England and least, though still considerable, in Scotland.

The total production of **Clover Hay** was 2,612,532 tons, the smallest crop since 1893 and 652,000 tons less than in 1910. The yields were lightest in the west-midland, eastern, and north-western counties of England. In Stafford the crop was nearly 14 cwts. per acre (over 40 per cent.) short of an average, and in Salop the shortage was nearly 12 cwts. (nearly 40 per cent.). In the north of Scotland the crop was nearly an average, but considerably short of an average in the south.

The crop of **Meadow Hay** amounted to 4,569,372 tons, the smallest total since 1901, and about 1,683,000 tons less than in 1910. In England the yields averaged from 3 cwts. per acre below average in the northern division to an average deficiency of nearly $7\frac{1}{2}$ cwts. in the west midlands, though in many counties the shortage was much more, Westmorland, Stafford, and Worcester having more than 10 cwts. under an average.

The production of both descriptions of hay aggregated 7,182,000 tons, being 2,335,000 tons less than in 1910 and about 20 per cent. below the average annual production of 1901-10.

POTATO AND ROOT CROPS.

The season of 1911 proved, on the whole, favourable for the **Potato** crop, though differing notably, as regards weather, from other recent years, in which there were also abundant crops. The average yield per acre was 6·69 tons, as compared with 6·44 tons in 1910, 6·39 tons in 1909, and 6·97 tons in 1908. The average yield of the decade 1901-10 was 6·08 tons per acre. With an increased acreage planted, the total production amounted to 3,825,312 tons, or about 350,000 tons more than in 1910, and 92,000 tons short of the very large crop of 1908. More than one-half of the English counties returned short crops, the most important being Bedford, Essex, Kent, Nottingham, Warwick, Worcester, Stafford, the North Riding, and Northumberland, but the great potato-growing areas had in many cases very good crops. Thus, on the 71,000 acres in Lincoln, the yield was $1\frac{1}{2}$ tons per acre (nearly 30 per cent.)

above average; on 30,000 acres in Cambridge the yield was $1\frac{1}{2}$ tons per acre (26 per cent.) above average; and on 43,000 acres in Lancashire the yield was 1-ton per acre (15 per cent.) above average. Better yields than usual were also returned for the large potato areas in Cheshire, the West and East Ridings, Durham, Devon, and Norfolk.

Wales returned many excellent crops, Cardigan, the leading county of the Principality for potatoes, being reported as having 3·15 tons per acre more than usual, while in the whole country the yield was 1·52 tons per acre (30 per cent.) above the ten-year average.

The yield of potatoes in Scotland averaged about half a ton per acre above the average, but there was a slightly deficient crop in the south-east, and in Fifeshire, Orkney, and Inverness. In Aberdeen, Forfar, and Perth and in the south-western counties yields were satisfactory.

Turnips and Swedes were the worst crop of the year, with an average yield for the whole country of only $10\frac{1}{2}$ tons per acre, as compared with the decennial average of $14\frac{1}{2}$ tons. The total production amounted to only 16,397,000 tons, which was about $6\frac{1}{2}$ million tons short of the average production of the previous ten years, and the smallest since 1899. The crops were not so poor in Scotland, Wales, and the north and north-west of England, as in the remaining divisions of England. In England as a whole the yield was $8\frac{1}{2}$ tons per acre, or 35 per cent. below the average. The worst yields were returned in the eastern counties (including Norfolk), the southern and midland counties, and in Chester, Derby, and Stafford among the north-western counties. In the midlands the crops were little more than two-fifths of an average, Warwick returning only $2\frac{1}{2}$ tons per acre, Buckingham $3\frac{1}{2}$ tons, Leicester $3\frac{1}{2}$ tons, and Gloucester $4\frac{1}{2}$ tons. In Stafford the yield of $6\frac{1}{2}$ tons per acre was $11\frac{1}{2}$ tons under average. Several counties of Wales returned heavier crops than usual, but poor crops elsewhere produced a net deficiency. Scottish yields were $2\frac{1}{2}$ tons per acre below average in the eastern counties, being worst in the south-east, whilst in the west different districts showed considerable variation, but the crops were slightly better than the average on the whole.

The **Mangold** crop was returned as $3\frac{1}{2}$ tons per acre below the ten-year average, being the lowest yield for 15 years. The total production of 7,480,433 tons was the smallest since 1903, when, however, the area under the crop was 50,000 acres less. Only seven counties in England, the most important being the East and North Ridings and Hereford, had better yields than usual. In Somerset the crop was $7\frac{1}{2}$ tons per acre deficient. In the eastern counties the shortage averaged $4\frac{1}{2}$ tons per acre, in the north-east $2\frac{1}{2}$ tons, in the south-east and south-west 5 tons, in the east midlands $2\frac{1}{2}$ tons, in the west midlands $4\frac{1}{2}$ tons, in the north-west $2\frac{1}{2}$ tons, but in the north only $\frac{1}{2}$ ton. Most Welsh counties had short yields, but good

crops were returned for Cardigan and Brecon. Small areas of mangold in the east of Scotland were, on the whole; short of an average; but in the extreme south-west some heavy crops were raised.

Hops.

The yield of **Hops** in 1911 averaged 9·92 cwts. per acre, being about $\frac{1}{4}$ cwt. more than in 1910, and nearly 1 cwt. above the average yield of the decade 1901-10. The total production was 328,023 cwts., exceeding the crop of 1910 by 25,000 cwts. The total crop was, however, 69,000 cwts. less than the average of the decade 1901-10, owing to the large reductions of area in recent years.

The best yields in 1911 were secured in Kent and Sussex, which were about 2 and 2½ cwts. respectively more than in 1910; in the other counties the results compared unfavourably with those of 1910. Of the total area under hops only 149 acres were returned as unpicked, of which 106 were in Herefordshire and 29 acres in the other western counties. The yield per acre of hops in the western area was distinctly poorer than in the previous year, Hereford giving only 5·81 cwts. per acre as compared with 8·21 cwts. in 1910, and Worcester 7·39 cwts. as compared with 9·22 cwts.

The quality of the hops was generally reported as excellent, one of the Crop Reporters in the south-east of England stating that the hops were the finest quality he had ever known. He observed: "We had a splendid quality hop in 1884, but in my opinion not up to the quality of this year." The absence of rain suited the crop and there was little trouble from fly, so that altogether hop-growers may be congratulated on the season of 1911.

CROPS OF THE UNITED KINGDOM.

The usual summary of the crops of the United Kingdom for the past three years is appended:—

CROPS.	1911.	1910.	1909.
	Quarters.	Quarters.	Quarters.
Wheat	8,089,000	7,074,000	7,900,000
Barley	7,225,000	7,881,000	8,618,000
Oats	20,367,000	21,974,000	22,342,000
	Tons.	Tons.	Tons.
Potatoes	7,520,000	6,348,000	6,877,000
Turnips and Swedes	21,670,000	30,319,000	30,094,000
Mangold	9,215,000	10,819,000	11,013,000
Hay (all kinds)	11,656,000	15,295,000	12,945,000

I have the honour to be, Sir,

Your obedient Servant,

30th December 1911.

R. H. REW.

SUMMARY of REPORTS received from the BOARD'S CROP REPORTERS on the Conditions affecting Crops and Live Stock and the Course of Farming Operations during the Year 1910-11, in each Division of Great Britain.

ENGLAND.

EASTERN DIVISION.

(Counties of Bedford, Huntingdon, Cambridge, Suffolk, Essex, Hertford, Middlesex, London.)

In the autumn of 1910 conditions were generally favourable for tillage and corn sowing, except in December, when very heavy rains made much outdoor work impossible and caused floods in low-lying areas. The area sown to wheat was, however, considerably greater than in 1909. For spring sowing the land generally worked well, though there were delays in March.

The season generally was summarised by a Suffolk reporter as follows: "The drought was the one outstanding feature of the year. It converted what promised to be an excellent crop into a short one of unusual quality."

The **Corn Harvest** was much earlier than usual; cutting was general at the end of July, and the ingathering was finished in most districts by the end of August. Both grain and straw were in excellent condition; wheat and barley were of the best quality, while oats were also very good.

Wheat was for the most part a fairly full plant, though showing the effects of December floods in places; it did well right through the dry June and July weather, and gave a bold ear and heavier yield than usual except in Huntingdon. **Barley** and **Oats** came up fairly well, but by the end of May were commencing to feel the drought. The continuance of rainless weather stopped the growth of straw, and both crops gave a light yield, especially oats. The drought also produced attacks of fly among **Beans** and tended to dry up **Peas**. Except in Bedford, the former gave bad yields, but the latter varied, crops in some counties being satisfactory.

Potatoes were well planted, and though they were thought to have suffered in the drought, the final yields in October were heavy in Cambridge, better than usual in Huntingdon, and only a little short elsewhere. Tubers were small but healthy, and of fairly good or good quality.

In the hot rainless weather **Mangold** were slow to grow, while **Turnips** and **Swedes** suffered severely from attacks of fly. Little or no improvement occurred as the season progressed. Mangolds gave very light yields, though of good quality. Turnips and swedes were badly blighted and stunted, and the yields were extremely bad.

Fruit gave good promise in April and May, but dry weather told against the crops, especially orchard fruit. Strawberries and raspberries gave average yields, but gooseberries and currants were short; owing to the drought much orchard fruit dropped and yields were generally short.

Even at the beginning of June both "Seeds" and Permanent Grass were expected to give over-average yields of **Hay**, but the drought seriously reduced bulk, though most of the crop was saved in good order and was of fine quality.

The wet weather in December, 1910, was adverse to sheep, but conditions improved and ewes came to the **Lambing** in good, healthy condition. The crop of lambs was, in most districts, quite equal to an average, and, in some instances, greater, but the contrary was reported from some districts, and, in some localities, cold weather in March and April and lack of young grass affected the health of ewes and lambs.

Cattle did fairly well during the winter, but a scarcity of pasture began to be felt in April. The grass improved later, but in July pastures dried up and **Stock** began to lose condition; the occasional rains were not sufficient to stimulate the growth of grass, and artificial foods had to be resorted to. These conditions continued for the rest of the season and with short hay and root crops the outlook for winter keep became very bad. Several reporters stated that as keep was making high prices, farmers preferred to sell their produce rather than buy in stock for fattening.

NORTH-EASTERN DIVISION.

(Counties of Norfolk, Lincoln, York, East Riding.)

The excellence of the weather for harvesting corn, hay, and potatoes was generally referred to by the reporters. In the case of corn the fine quality of grain and straw and favourable prices largely compensated for the light yields of barley and oats. For graziers, however, the season was unfavourable. Generally, the East Riding experienced rather better conditions than Lincoln and Norfolk. The season suited farmers in the valley of the Trent and beside the Aueholme.

The lateness of the corn harvest of 1910, the suitability of the weather for potato-raising, and the hardness of the ground delayed cultivation and wheat sowing, except in the East Riding. In December the land was too wet in Norfolk, and much flooded in parts of Lincoln. In spite of these drawbacks the breadth of wheat sown was considerably greater than in 1909. Spring sowings were late owing to cold and wet weather.

Crops ripened rapidly and, in some cases, prematurely; the **Corn Harvest** became general in the early part of August and proceeded rapidly. The bulk of the grain had been gathered in fine condition by the end of the month in Norfolk and Lincoln, and by the second week of September in the East Riding.

Wheat was at first backward owing to the wet winter, and often a thin plant, but the crop improved in April, and made a vigorous and healthy growth until harvest. Yields above average were obtained in each county, the East Riding showing the largest excess. **Barley** and **Oats** came up well, but from May onwards suffered from drought, and straw was short. The yields of corn were most satisfactory in the East Riding, where oats were only half-a-bushel under average; barley and oats were both short in Lincoln and Norfolk. **Beans** and **Peas** gave varying promise at the start, but the former were attacked by fly, and gave very poor yields. Peas suffered most in Norfolk, but were only slightly deficient elsewhere.

Potatoes were planted under favourable conditions in April, the breadth in Lincoln being increased by 7,000 acres. The crops made a strong and healthy growth, though affected in north-west Lincoln by a frost in mid-June, and suffering from the drought on some soils. When harvested, the crops gave better returns than anticipated, being well above average generally. The condition and quality were generally good, though second growth after rains appeared in West Holland and West Norfolk, and some disease was reported in the East Riding.

Mangolds obtained a full plant and started well, but the absence of rain told against the crop in July, especially in Norfolk. The roots were raised in good condition in October, and were of satisfactory quality though smaller than usual. In the East Riding there was a fairly good yield, but in Lincoln and Norfolk the yield was deficient. **Turnips** and **Swedes** suffered greatly from the drought, and mildew and insect attacks became very prevalent in September. Only half a crop was returned from Norfolk, but results in Lincoln and the East Riding were much better.

The lack of rain was felt by "Seeds" and Permanent Grass as early as April, and in spite of a few rains the subsequent dry weather further reduced the bulk of the **Hay** crops. The harvest was rapidly completed, the greater portion of the hay being secured in very good order.

The results of the **Lambing** season were least satisfactory in Norfolk, where the lambs suffered severely from cold weather early in April. In Lincoln the crop was generally satisfactory, except in the north-east. Results varied in the East Riding.

Live Stock generally wintered fairly well, and made satisfactory progress in the spring. Pastures were dried up in July, and the shortage of grass continued until October, the difficulties of graziers being in some instances added to by scarcity of water. Stock fared poorly in consequence; in August the yield of milk became very short in some districts. The outlook for winter keep was bad in Norfolk and Lincoln, but better in the East Riding.

SOUTH-EASTERN DIVISION.

(Counties of Kent, Surrey, Sussex, Berkshire, Hampshire.)

In Kent and other districts where hops are grown, the remunerative returns from a fair crop of most exceptional quality provided a note of satisfaction in the Reporters' reviews of the season. Elsewhere the excellent quality of corn, straw and hay were more than set off by the light yields and the unfavourableness of the season to graziers, sheep farmers and milk producers.

Generally, autumn cultivation and wheat sowing made good progress in 1910 until brought to a standstill by heavy rains in December, and the breadth planted was only a little more than in the previous year. In the spring, crops were sown under fair conditions though the work was hindered in March on some heavy soils.

The **Corn Harvest** commenced in many districts in the third week of July, and was speedily completed in good weather, very little remaining out in September. Wheat was the best in quality; barley was also very good as a rule, but oats were often thin and of light weight.

Wheat was a full plant, except where sown late, but backward in places until the late spring. For the rest of the season the hot dry weather improved prospects, and the yield was slightly over-average, with best results in Berkshire. Reporters in Kent commented on the heavy weight of the grain, one stating that many fields weighed 67 lbs. per bushel. **Barley** and **Oats** started well, but were seriously affected by the drought, and gave short yields of grain and straw. **Beans** and **Peas** also grew well until June, after which the former were attacked by fly and the latter dried up, poor yields resulting.

A large proportion of the **Potatoes** were planted in favourable weather; the crop started well, but after June it was checked by dry weather; when the tubers were lifted in October, in good weather, yields were only just below an average, except in Hunts. The quality was fairly good, though sometimes affected by second growth.

The root crops made fair progress until July, as some welcome rain did good in June; afterwards the hot dry weather was all against them; a fair plant of **Turnips** and **Swedes** was rare, and mildew and insect attacks were prevalent, and though there was some improvement in October, the final yield was only half an average crop. **Mangolds** were pitted in good condition, and were of good quality though small; the yield was about three-fourths of an average.

Clovers and other "Seeds" were fairly promising until the beginning of June, but the drought stopped the growth and yields of **Hay** were short. Some rain in June hindered harvesting, but the work was finished quickly and the crop was of good quality.

Hops made a strong and rapid growth until June, and were then checked by cold nights; vermin then appeared, but washings were successful. The bine was somewhat slack in July from lack of rain, but the hops kept clean and there was little mould; prospects improved in August and conditions favoured high quality, one reporter describing the crop of 1911 as the finest within memory. No rain interfered with the picking and practically no hops were left to blow away. The yields were above the ten year average generally, with best results in east Kent and Sussex.

Among **Fruit** crops, strawberries gave fully average crops except in mid-Kent and north-west Hants; raspberries and currants were short in Kent, but satisfactory elsewhere. Gooseberries gave small yields in Berkshire and Sussex but an average in other counties. Orchard fruit suffered from blight and drought, and fruit dropped prematurely, and cherries, pears, and plums were short; apples, however, gave good yields.

At the **Lambing** season, ewes were in poor condition in some districts though strong in others. For the division as a whole the fall of lambs was a little below an average. The wintry weather early in April caused many losses of lambs, and in some flocks the loss of ewes was greater than usual.

Stock generally made satisfactory progress during the winter and spring, except that much foot-rot was reported among Kentish flocks. There was a scarcity of grass in April, but rains brought an improvement until July, when pastures were dried up and remained bare for the rest of the season. Water also was scarce; all classes of stock lost in condition and artificial foods were necessary. The outlook for winter keep was bad, as hay, roots, and straw were all short.

EAST MIDLAND DIVISION.

(Counties of Nottingham, Leicester, Rutland, Northampton, Buckingham, Oxford, Warwick.)

Most reporters stated that the past season was very bad for graziers, owing to the short yields of hay, straw and grass, the declining prices for fat stock and the bad out-look for winter feeding; occupiers of mixed arable and grass farms, however, did not suffer so severely from the drought. The year was very favourable for thoroughly cleaning the land.

The autumn months of 1910 were wholly favourable for cleaning fallows and stubbles and drilling wheat, and work was well forward before excessive rains in December stopped further progress. On some flooded areas, however, the late sown wheat was backward and weak at the start. Sowing of spring corn progressed rapidly in February, but was hindered in March by variable weather.

The corn ripened rapidly and **Harvest** was commenced in the last week of July; with very favourable weather, practically all crops were secured early, usually in excellent condition, and the work was over in most places in the third or fourth week of August. All corn was of good, and frequently excellent quality.

The dry season generally suited **Wheat**, which was a full and vigorous crop except on lands badly flooded in December; though frequently short of straw the crop eared well, and yields were better than usual except in Northampton and Warwick. Spring corn started well but suffered from the summer drought and straw was short. **Barley** gave a better yield than usual in Leicester and Rutland, but for the division as a whole was $2\frac{1}{2}$ bushels per acre short. **Oats** were only two-thirds of a bushel short, as there were satisfactory results in Leicester, Rutland, and Northampton. **Beans** and **Peas** also suffered from the dry weather, especially the former which were affected with blight. Peas, however, were above average in Nottingham and Northampton but barely average for the whole division. All spring corn gave very poor returns in Oxford and Warwick.

Potatoes were planted under good conditions and made a vigorous start; the dry weather in July and August, however, injured the prospects and the yield was, on the whole, below an average, and the potatoes, though lifted in good condition, had frequently started a second growth.

The **Mangold** crop was saved by rains late in June, but the continued drought told against them; the roots when pulled, were of good quality, though smaller than usual. **Turnips** and **Swedes** did very badly from the first, and in October were very much affected with mildew, many crops being worthless. Little more than two-fifths of an average yield was returned for the division as a whole, and in Leicester, Buckingham, Oxford, and Warwick results were poorer still, the last county giving only $2\frac{1}{2}$ tons per acre as compared with an average of 14 tons.

"Seeds" tended to be patchy in some places in the spring, but on 1st June an average crop of **Hay** was expected; the dry weather, however, affected both these crops and meadow hay, and yields were very light, though of good quality and rapidly harvested.

Ewes came to the **Lambing** season in satisfactory condition in most places. The fall of lambs was quite satisfactory or better than usual, though the contrary was stated in some districts; ewes and lambs generally did fairly well.

During January outdoor **Stock** did not do very well owing to the wet state of the ground, but conditions afterwards improved. Some shortage of keep was experienced in April, and though there was some improvement in May, the June weather made grass short. Where the water supply was good stock did fairly well during the summer, but generally pastures were burnt up, and stock did badly; hay and artificial foods became necessary. Milking cows gave much reduced yields in many districts. No improvement took place until October when rains benefited the pastures. The outlook for winter keep was bad.

WEST MIDLAND DIVISION.

(Counties of Salop, Worcester, Gloucester, Wiltshire, Monmouth, Hereford.)

The season was not satisfactory for farmers. Corn growers suffered less than dairy farmers and stock raisers as, although wheat alone of the

crops gave a better yield than usual (it was, however, deficient in several counties), the excellent quality of the corn, improved prices for barley and oats, and favourable opportunities for cleaning the land formed some compensation for light yields. Hop growers also had excellent prices to compensate for rather light crops.

The shortage of pasture, the unpromising prospects for winter keep resulting from the shortage of hay, straw, and root crops, and the decline of prices for stock made the season most difficult for graziers and dairy farmers.

In 1910 good progress was made in cleaning and ploughing the land until the second week of November, after which wheat sowing was greatly hindered by frosts and heavy rains; the area planted was thus less than in the previous autumn. In January and February more wheat could be sown, but the sowing of barley and oats was often troublesome in March and April.

The **Corn Harvest** was commenced and finished in August, the grain being got in rapidly in good condition. Samples of wheat were best, while oats and barley were occasionally thin grain.

Wheat was generally a good plant, though somewhat backward at first, and it improved after May and came into ear well. The yields were very satisfactory in Wilts, Monmouth, and Hereford, but somewhat short elsewhere. **Barley** started well, but became irregular, thin and short of straw during the drought, and gave short yields, except in Monmouth. **Oats** were very thin and poor in some districts, and gave bad yields except in Monmouth and Hereford. **Beans** and **Peas** gave very poor yields.

Potatoes were planted in good order in April and came up well; in May the lack of rain was felt, rains did good in June, but in July hot weather caused early ripening. When lifted in September and October, tubers were small but of good quality, though some second growth was evident. The yields were somewhat lighter than usual, except in Monmouth and Hereford.

Mangold came up fairly well as a rule, and withstood the drought though growth was retarded. The roots were small, though of good quality. Yields were very poor in Worcester and Wiltshire, and short elsewhere, except in Hereford. **Turnips** and **Swedes** suffered much from fly in the early stages, and many fields had to be resown. In September they were badly affected with mildew and blight, and they were finally returned at less than half an average crop, being particularly bad in Gloucester.

"Seeds" were full and promising until May, after which growth was checked, especially in June. Meadow crops were equally affected, and the **Hay**, though of fine quality, gave only about three-fourths of an average crop from "Seeds," and about two-thirds from meadows.

Hops made a good growth, but washing for aphids was general in May and was continued in June, when some rain proved beneficial. The crop was much better in some parishes than in others, and in some cases it was almost a failure. Though the yield was not heavy, the quality was exceptionally good. Some areas had to be left unpicked.

All kinds of orchard **Fruit** promised well in the late spring, but in May the drought did harm, though subsequent rains did good. Currants, gooseberries, and raspberries were about average crops; but in orchards yields varied considerably: apples gave fairly good yields, but pears were short. Plums proved heavier than expected in South Worcester.

At the **Lambing** season, ewes were generally in good condition ; the crop of lambs varied in different districts, but, on the whole, was not more than an average, and there were considerable losses of lambs and ewes in places.

After June, pastures were burnt up and did not recover until October. All classes of **Stock** suffered in consequence, and milking cows gave a short yield. The outlook for winter keep was serious, though the open autumn brought some relief.

SOUTH-WESTERN DIVISION.

(Counties of Somerset, Dorset, Devon, Cornwall.)

As in other parts of the country, the drought lasting throughout the summer was the outstanding feature of the season. Cereal and potato crops gave satisfactory returns but pastures suffered severely and summer food was a source of anxiety to dairy farmers who had to fall back on the slender stocks of hay and artificial foods ; the outlook for the winter was bad, but the mild autumn of 1911 afforded some relief.

The autumn of 1910 was at first favourable for cultivation but continual wet weather intervened so that work was in arrears and less wheat was sown. Spring sowing, however, was carried on under most favourable conditions, as a rule.

The **Corn Harvest** commenced in the latter part of July and, with the exception of some late pieces in Cornwall, was completed by the end of August. All three cereals were in very good condition, wheat was of excellent quality, and barley and oats, though in some cases thin, were in the main also of good quality.

Wheat was at first backward where sown late and some pieces were so poor that they were ploughed up and resown. The crop improved later, especially after May, being healthy and vigorous though short in straw. The yields were well above average except in Dorset.

Barley was at one time the most promising corn crop, but suffered from lack of rain ; the yields were better than usual in Somerset and Devon, but deficient in Dorset and Cornwall. **Oats**, after a fair start, suffered most from the drought and were thin and irregular, and except in Somerset the yields were somewhat under-average. **Beans** were severely affected with blight and only yielded three-fourths of an average return.

Potatoes were well set in April and came up well ; the absence of rain checked growth in July, but the yield averaged one ton per acre more than usual ; tubers were small but generally of good quality with very little disease, but occasional second growth.

Mangolds were an irregular plant and suffered from the excessive drought ; occasional rains did good but the roots lifted five tons per acre short of an average, though of sound quality, and were stored in good condition. **Turnips** and **Swedes** were a thin and patchy crop owing to the drought and damage by fly. Blight and mildew became prevalent in September and the yields were returned at about three-fifths of a crop.

"Seeds" were generally fairly promising at the end of April though short of clover in places, but the absence of rain in May and June checked the growth of both rotation and permanent grasses. The **Hay** harvest was quickly over in Somerset though a little hindered by rain elsewhere ; the crop was secured, however, in good condition and was of fine quality. Yields were light in each county.

Fruit promised well in the spring, but the orchards were affected by the drought, much fruit falling prematurely. Apples yielded about an average crop on the whole.

Ewes were generally in fair condition for the **Lambing** season, but suffered on some lands from chills. The Dorset Horn flocks which lambed down from December to February had varying results, being better in Somerset than Dorset. Longwools and Downs gave about an average crop of lambs. The losses, though severe in some districts, were not generally greater than usual.

Stock suffered from the wet winter in places, but improved with better weather in February. Some foot-rot was reported among sheep in Devon. There was some scarcity of grass early in April, but rains promoted a fair growth until the drought set in in May. Keep was, however, sufficient and stock thrived well until July when pastures were much burnt up. The scarcity of grass lasted until October. Where water was sufficient stock did fairly well, but in many districts both cattle and sheep suffered from lack of grass and the supply of milk was reduced. Hay and artificial food had to be given. With short crops of hay, straw, and roots the outlook for the winter was unpromising.

NORTHERN DIVISION.

(Counties of Northumberland, Durham, York, North and West Ridings.)

Although the hot dry weather of the summer of 1911 prevailed in the counties of this division also, and told against the green crops, they suffered less severely than any other part of England, owing to the timely arrival of rains in the latter part of June and to the beneficial effect of autumn showers upon the root crops. Wheat gave a fairly good yield, barley was a little above average and oats, beans and peas were only slightly deficient; potatoes yielded well, mangolds were short in the West Riding only, while turnips and swedes averaged only one ton per-acre less than usual; "seeds" hay was very light, but meadow hay, though also short, was not nearly so poor a crop as in many other parts of the country. The corn yields were of very good quality, and prices, for barley particularly, proved remunerative. Graziers and dairy farmers, however, with a shortage of grass throughout, found the season very difficult and expensive.

The weather conditions in the last months of 1910 were generally favourable to farm operations and an increased area of wheat was sown; conditions were also fairly favourable for sowing spring corn, and all the corn crops started well.

The **Corn Harvest** was unusually early, and a large proportion was cut and stacked at a minimum of expense by the end of August, while all was over by the third week of September.

Wheat was best of the corn crops, being generally a full plant, vigorous and healthy; it steadily improved, shot into ear very early, and gave a fairly heavy yield of fine quality. **Barley and Oats** were adversely affected by the dry weather in June, and straw was short; at the end of the month, however, some rains improved the barley more particularly. The yields of barley were slightly deficient in Durham and the North Riding, but satisfactory elsewhere; oats were above average in Northumberland and the North Riding.

The ground worked well for planting **Potatoes**, and although the crop was injured by frosts in June, and lacked rain subsequently, the yield was better than expected, being fully equal to the average, and of good quality.

Mangolds were a fair plant on the whole, but were checked by dry weather; rains at the end of August did good, and the roots when stored, in October, were of good quality. **Turnips** and **Swedes** were much damaged by fly and drought at the start, and many pieces were resown. In August rains improved the crops, although many were rotted and mildewed. The mild autumn favoured the crop, which was returned at about an average in Durham and Northumberland, but was somewhat deficient in Yorkshire.

"Seeds" did not come well through the winter, many failures of clover being reported. At the beginning of June, however, good crops of meadow and "seeds" **Hay** were expected in several localities. The June drought checked growth, and rains were too late; the crop was gathered in fine weather at little expense, and was of good quality.

Ewes were in fair condition at the **Lambing** season. On the low lands the crop of lambs was at least average, and, on the whole, losses were not greater than usual, although ewes were frequently short of milk owing to lack of grass; moorland ewes did not lamb so well, and there were some heavy losses of lambs.

Stock generally wintered fairly well, although sheep on turnips suffered in December and January from the wet state of the land. Pastures were usually full of grass in May, but afterwards became very bare; the scarcity of grass and of water lasted until October, in spite of occasional rain. Stock consequently lost condition and artificial foods were resorted to; a shortage of milk also occurred. Pastures improved during October, but winter keep was scarce, owing to the short yields of hay, straw and roots.

NORTH WESTERN DIVISION.

(Counties of Cumberland, Westmorland, Lancaster, Chester, Derby, Stafford.)

In this division the counties of Chester, Derby, and Stafford suffered more severely from the drought and all crops were much smaller, as a rule, than in the more northerly counties. On the whole, the season was not unfavourable for arable farmers as satisfactory prices for corn and potatoes compensated more or less for the lightness of some of the crops, while harvesting was accomplished at a minimum of expense. For dairy farmers and graziers, however, who form the majority in this division, the shortage of grass consequent upon the summer drought necessitated the purchase of the high-priced feeding stuffs, and the light crops of hay, straw, and turnips made the outlook for winter keep unsatisfactory, though the growth of grass late in the autumn and the open weather afforded some relief.

Weather conditions favoured the sowing of autumn and spring corn in most places, and the crops made a promising start. The corn ripened rapidly and **Harvest** was commenced in the latter part of July in many districts. The work was carried on quickly and the grain was stacked in very good condition. Wheat and barley were of very good quality, especially the former. The **Wheat** yield averaged a bushel

per acre more than usual, though it was below average in Cumberland and Stafford. **Barley** was 5 bushels per acre short, and the yield was particularly poor in Stafford. **Oats** were rather small in the grain in some districts, but otherwise sound; the yield averaged 5 bushels less than usual.

The land was in excellent condition in April for planting **Potatoes**, and a greater breadth was placed under the crop. The potatoes started well, but were checked by dry weather in May and June, and early varieties were not heavy crops. Rains at the end of June and again in August did good, but the yield was not expected to be so good as usual. Weather was favourable for lifting the crops, and the yields came up heavier than anticipated, averaging half a ton per acre better than usual, though light in Derby and Stafford. On the large area in Lancashire the yield was one ton per acre above average. The tubers tended to be small, but were usually of good quality.

Mangolds were backward at first, but occasional rains improved them; crops in Cumberland and Westmorland were heavier than usual, but those in Derby and Stafford were very light. Quality and condition were good. **Turnips** and **Swedes** suffered severely in the early stages, and many areas were resown; they were affected with mildew in September, and yields were very light in the southern but better in the northern counties.

Good crops of **Hay** were expected in the northern counties of the division at the end of May, though elsewhere rain was needed, but the drought reduced the crop considerably in all counties. Meadow hay was only $1\frac{1}{2}$ cwt. per acre deficient on the large area in Lancaster, but very light elsewhere. The crop was secured in good condition.

At the **Lambing** season ewes were generally in fairly good condition, and the fall of lambs was, on the whole, quite satisfactory, though some severe losses were sustained in a few districts owing to cold weather at the beginning of April.

Wet weather in December was adverse to sheep, but otherwise **Stock** wintered well. Keep was abundant until April, when pastures were somewhat bare, though they improved in May. After that month the lack of rain told on the state of the pastures, and they became very bare until September. Water was also scarce, but, considering the circumstances, stock maintained fair condition until August, though the yields of milk fell off. Conditions improved in the autumn, but the scarcity of winter keep caused anxiety.

WALES.

The effect of the summer drought upon the crops was much more severe in some districts than in others; instances occurred in which a particular crop suffered very much in one county while in a neighbouring county the yields returned were better than usual; such instances were frequent even in the case of turnips and swedes and mangolds, and more rarely, in the case of hay crops. It is difficult to make a general statement on the results of the crops, owing to the numerous exceptions which would have to be made. Potatoes, however, were uniformly satisfactory. The general shortage of grass during the summer told against the progress of live-stock, and a scarcity of milk was reported. Although pastures improved in the late autumn, winter keep of all kinds was short.

Owing to wet weather in November and December, 1910, the area sown with wheat diminished slightly. As a rule, spring corn was sown under favourable conditions.

The **Corn Harvest** began and ended in August in most districts, and crops were secured in good condition and with little expense.

The yield of **Wheat** was better than usual in six counties, and deficient in six, but on the balance was above an average, with best results in the north. The grain was of uniformly good quality. Two counties, Cardigan and Carmarthen, had fairly good yields of **Barley** and **Oats**, but elsewhere crops were light. The grain was sometimes light, owing to too rapid ripening, more particularly in the case of oats. **Beans** were above the average in Montgomery, but short in Denbigh and Flint.

Dry weather favoured the planting of **Potatoes** early in April, but later rains delayed the work. In June, dry weather checked the growth, but subsequently the crops grew vigorously; in September some amount of second growth was reported. Crops were lifted in good condition during September and October, and were generally of sound quality, though diseased and affected by second growth in some places. Yields were very heavy in Cardigan, and averaged $1\frac{1}{2}$ tons better than usual for Wales as a whole.

Root crops varied considerably. **Mangolds** were about an average in Carnarvon and Carmarthen, fairly good in Brecon, and very heavy in Cardigan; elsewhere the season was unfavourable to them. Five counties returned over average crops of **Turnips** and **Swedes**, and results for Wales as a whole were only $1\frac{1}{2}$ tons below average, though some counties had very poor crops.

Very good crops of **Hay** were returned from Cardigan, and an average yield of meadow hay was secured in Anglesey; elsewhere crops were very light, though not to the same extent as in some parts of England. The quality of the hay was good.

In several counties ewes had suffered in condition, owing to the prolonged wet weather of November and December. The **Lambing** season, however, was for the most part favourable, except on the uplands, where the mortality among ewes and lambs was rather greater than usual. The crop of lambs was about equal to the average.

Stock generally wintered well, and improved during the spring, though some local scarcity of grass was reported in April and May. About the middle of June pastures became bare; rain later did good, but from July to September grass was very scarce, owing to the drought, and stock did not progress well, but often lost condition where water was scarce. Conditions improved in October, but the outlook for the winter was unfavourable.

SCOTLAND.

EASTERN DIVISION.

(Counties of Nairn, Elgin, Banff, Aberdeen, Kincardine, Forfar, Perth, Clackmannan, Kinross, Fife, Linlithgow, Midlothian, Haddington, Berwick, Roxburgh, Selkirk, Peebles.)

The season was, on the whole favourable for corn growers. Good conditions prevailed at seed-time, and although the drought, which was partially broken by rains after mid-June and mid-July, reduced the yields of spring corn, compensation was found in the excellent quality of the crops, the small expense in harvesting them, and the higher prices at which they were sold. The remunerative prices of barley were the subject of comment by many reporters. In the Lothians the season was described as "on the whole an excellent year for farmers."

The drought was, however, a more serious matter for graziers. A Reporter in Perthshire wrote :—"Probably in east Perthshire the effect of the drought so long continued has been worse than in any other part of Scotland. Pastures have been very poor and a lot of money lost." The shortage of turnips, though not so marked as in England, was expected to restrict considerably the number of cattle fattened during the winter.

The **Corn Harvest** was very early and very brief. Cutting was general by mid-August, and the oat harvest was over in most places by mid-September, though a little later in the north. Wheat and barley were harvested earlier. Quality and condition were in most cases very good or excellent, barley being perhaps best. Straw was short.

Wheat averaged three bushels per acre better than usual. **Barley** was deficient in the central and some south-eastern counties, but was returned as an average crop for the division as a whole. The yield of **Oats** was light south of Forfarshire but quite satisfactory in the north, and for the division as a whole was only half a bushel short. **Beans** generally gave very poor yields.

Potato planting was carried on under good conditions from March to May on a larger breadth than in 1910. Timely rains did good in June and July, dry weather checked the growth in August, but rains were beneficial to the later crops in October. Most crops were lifted in clean condition by the end of October, and were free from disease and of good quality. In Fife and some south-eastern counties, yields were somewhat smaller than usual, but elsewhere they were better than usual, and for the division as a whole the result was one third of a ton over average.

Early sown **Turnips** and **Swedes** started well, but later sown areas did badly, and resowing was fairly general; rains did good in July, but the dry weather of August and September told against the crops; mildew was prevalent, and also some finger and toe. During November, however, rains improved the swedes. Except on the small areas in Clackmannan and Kinross yields were poor, averaging $2\frac{3}{4}$ tons less than usual for the division, the worst results being in the south-east.

At the beginning of June the **Hay** crop was expected to be much heavier than usual, but the drought reduced bulk. "Seeds" hay was, however, less than 1 cwt. per acre short in the north though very light in the south. Meadow hay gave a poor yield. The crops were saved in good condition and were of fine quality.

Ewes were in good condition at the **Lambing** season; generally the fall of lambs was better than usual, and in some instances very good, while losses were fewer.

Stock wintered well, keep being plentiful; grass also grew well until June, but at mid-July pastures were generally bare. Artificial feeding stuffs became necessary in many cases. Pastures were still bare in September and October. Stock did not progress well; a mild November improved conditions, but winter keep was short.

WESTERN DIVISION.

(Counties of Shetland, Orkney, Caithness, Sutherland, Ross and Cromarty, Inverness, Argyll, Bute, Dumbarton, Stirling, Lanark, Renfrew, Ayr, Dumfries, Kirkcudbright, Wigtown.)

The results of the season varied in different counties and within individual counties, but on the whole it was fairly satisfactory to

farmers as timely rains in June and July mitigated the worst effects of the drought. Lightness of the crops in some districts, on account of the drought, was compensated for by the rapidity of the harvest, the excellent quality of the corn and hay, and by higher prices. In some dairying districts reporters mentioned with satisfaction the better prices obtained for cheese.

In the autumn of 1910 conditions were favourable, as a rule, for ploughing stubbles and general cultivation; spring ploughing and sowing were also done under good conditions.

The **Corn Harvest** was much earlier than usual, many crops being cut and secured between mid-August and mid-September; some crops in the north were exposed to broken weather after mid-September, but little harm was done. The condition and quality of the corn were mostly "good," "very good," or "excellent."

All corn braided well and was very promising until June, when dry weather checked oats and barley. Rains in July improved prospects, but straw remained often very short. The yield of **Oats** was returned above the ten-year average in many counties, especially in the north, but poor yields in Sutherland, Lanark, Dumfries, and Kirkcudbright pulled down the result for the division as a whole, which was a quarter of a bushel under average. The small areas allotted to **Wheat, Barley** and **Bere** gave good returns in most instances. **Beans** were somewhat better than usual in Stirling and Ayr.

Potato planting was usually done under good conditions and a vigorous growth appeared. Some early crops in Ayr were affected by dry weather in June; rain did good in July and crops continued to do well until lifted, except in some parts of the northern counties. When raised, the quality and condition were very good, and yields were better than usual in all counties except Orkney and Inverness.

Turnips and Swedes started well in some districts where sown early, but generally were an irregular and backward plant owing to the dry weather in June, and considerable areas were resown. Rains in July brought some improvement, but the dry weather of August and September told against the crops, and in the extreme south-west attacks of mildew and rotting were frequent. The mild autumn improved the crops, however, and yields were returned higher than anticipated. In the north-west, the crop averaged $1\frac{1}{2}$ tons per acre more than usual, though short in Shetland and Inverness. In the south-west the crop averaged a ton less than usual though quite satisfactory in Dumbarton, Stirling, Renfrew, and Ayr. **Mangolds** were generally heavier crops than usual.

Hay was a light crop, but "seeds" hay was not so poor as in the eastern counties; indeed, in the north-west both "seeds" and "meadow" crops were little different from those of an average year. The harvest was delayed in some districts by wet weather in July but not much harm was done and the crop was of good quality.

In some districts ewes suffered from the rough weather in February and cold east winds in March, but, as a rule, they were in fairly good condition at the **Lambing** season. Weather conditions were favourable in April and May, and the crop of lambs proved quite up to the average, and frequently better, with few losses, though stormy weather in the latter part of April affected the flocks in some exposed positions.

Stock wintered well on the whole, and outlying cattle needed less hand feeding than usual. Grass became somewhat scarce in June; in July rains did good, but the drought throughout August and part of

September kept pastures bare, although rains in the latter month improved their condition. Stock did fairly well through the summer, except in a few instances, though milking cows suffered in the south-west, and artificial foods were necessary to maintain the milk supply. Though a serious shortage of keep for the winter was not the rule, supplies were limited, more especially in the southern counties of the division.

AGRICULTURAL STATISTICS OF GREAT BRITAIN.

The annual AGRICULTURAL STATISTICS for 1911 are issued in five parts, as follows:—

Part I.—(Cd. 6021, price 5½d.).

Report.

Tables: Section I.—Area under Crops and Live Stock.

" " II.—Value of Land.

Part II.—(Cd. 6056, price 4½d.).

Report.

Tables: Section III.—Produce of Crops.

" " IV.—Weather Statistics.

Part III.—(Cd. 6272, price 4½d.).

Report.

Tables: Section V.—Prices of Corn and Bread.

" " VI.—Prices of Live Stock and other Agricultural Produce.

" " VII.—Supply of Live Stock at Markets.

Part IV.—Imports and Exports of Agricultural Produce. (*In the press.*)

Part V.—Foreign and Colonial Statistics. (*In preparation.*)

NOTE.—These publications may be purchased (either directly or through a bookseller) only from the agents mentioned on the title-page.

BOARD OF AGRICULTURE AND FISHERIES.

AGRICULTURAL STATISTICS, 1911.

PART III.

REPORT TO THE SECRETARY OF THE BOARD OF AGRICULTURE AND FISHERIES.

SIR,

I BEG to submit the third part of the Agricultural Statistics for 1911. As I stated in the Report on Part I., the volume of Agricultural Statistics is now issued in five parts instead of four, as hitherto, and the third part, which previously included tables of agricultural imports and exports, is now restricted to tables of prices, together with such statistics of supplies at markets as relate to home-bred live stock.

Corn.

The average price of wheat in 1911, as calculated from the weekly returns received from the 190 towns scheduled under the Corn Returns Act, was 31*s.* 8*d.* per quarter, being the same as in 1910. The course of prices in the two years was, however, different. Whereas in 1910 there was an almost continual decline, in 1911 there was, on the whole, a steady rise, the result being that in the last week of 1911 the average price was within 3*d.* per quarter of that returned in the first week of 1910, although during the interval it had stood at about 4*s.* per quarter less.

The general course and range of wheat prices during the past seven years may be summarised as in the following statement :—

Year.	Annual Average.	Monthly Averages.		
		Highest.	Lowest.	Range.
	<i>s.</i> <i>d.</i>	<i>s.</i> <i>d.</i>	<i>s.</i> <i>d.</i>	<i>s.</i> <i>d.</i>
1905 - -	29 8	32 1	26 10	5 3
1906 - -	28 3	30 3	26 1	4 2
1907 - -	30 7	35 3	26 1	9 2
1908 - -	32 0	35 3	30 10	4 5
1909 - -	36 11	43 3	31 8	11 7
1910 - -	31 8	33 6	29 4	4 2
1911 - -	31 8	33 2	30 1	3 1

While the highest monthly average in 1911 was slightly lower than in 1910, the lowest monthly average was higher, and the range of prices was more restricted, than in any of the preceding six years.

The highest weekly average in 1911 was 33s. 4d. and the lowest 30s. per quarter, as compared with 33s. 9d. and 29s. respectively in 1910. The extreme range of weekly averages was thus 3s. 4d. per quarter in 1911, as compared with 4s. 9d. per quarter in 1910. In the first week of 1911 British wheat averaged 30s. 5d., and the weekly prices ranged between 30s. and 31s. per quarter until May, when they advanced rapidly, and 32s. 8d. was returned at the end of that month. Prices fell, with a slight interruption in July, until mid-August, though the large sales of new wheat then commencing did not reduce the price below 31s. 6d. per quarter. From mid-August prices advanced steadily, until 33s. 4d. was returned at the beginning of November, and for the remaining weeks of the year the weekly average ranged around 33s. per quarter.

The earliness and rapidity of the harvest of 1911 and the excellent condition of the wheat when secured appear to be reflected in the returns of the quantities sold at the scheduled towns. Only 88,000 quarters of wheat were returned as sold in July, but in August the sales rose to 222,000 quarters and in September to 585,000 quarters. The July quantity was exceeded so recently as 1910 and 1908, and also in 1900, but the August sales have, during the present century, only been exceeded in 1908. The sales in September, however, were the largest ever returned for that month in any year since the passing of the Corn Returns Act in 1882. The previous highest quantity returned as sold in September was 455,000 quarters in 1905.

While the yearly average price of wheat was the same in 1911 as in 1910, it may be noted that the average price during the three months September, October, and November, which represents, approximately, the price at which the bulk of the harvest of each year is disposed of by farmers, and on which the estimates of the value of the grain crops, made in Part II. of the Agricultural Returns, are based, was, in the case of wheat, 2s. 2d. per quarter higher in 1911 than in 1910.

The average price of barley in 1911, 27s. 3d. per quarter, was 4s. 2d. more than in the previous year. For the three months September to November, when the bulk of the crop is marketed, the price was 30s. 10d. in 1911 and 24s. 7d. in 1910, an advance of 6s. 3d. per quarter. The annual average is the highest since 28s. 2d. per quarter was returned in 1891, while the highest weekly average, 34s., in December was the highest for any week since November 1883.

The following is a statement of the course of barley prices during the past seven years, with the range of monthly averages:—

Year.	Annual Average.	Monthly Averages.		
		Highest.	Lowest.	Range.
	s. d.	s. d.	s. d.	s. d.
1905 - -	24 4	25 1	22 9	2 4
1906 - -	24 2	25 3	23 0	2 3
1907 - -	25 1	27 6	23 7	3 11
1908 - -	25 10	27 4	24 0	3 4
1909 - -	26 10	28 0	25 1	2 11
1910 - -	23 1	25 2	20 2	5 0
1911 - -	27 3	33 7	24 1	9 6

The range in barley prices was, as will be seen, wider in 1911 than in any of the previous years, the customary rise when the new crop came into the market being more than usually marked.

At the beginning of January the weekly average price of barley was 23s. 11d., and prices gradually advanced until 25s. 7d. was reached in the first week of May, after which only nominal sales were returned. The new crop commenced to reach the markets at mid-August, the condition and quality of the grain being generally excellent, and the markets immediately responded. In the last week of August the Gazette weekly average price was 28s. 10d. per quarter, and, after a slight fall, prices moved steadily upwards, until 34s. was returned in the second week of December. The year closed with the price at 33s. 4d. per quarter.

The returns of barley sold indicated, equally with those of wheat, the earliness of the harvest and the exceptionally good condition of the grain. In September the total quantity returned as sold was 681,000 quarters, as compared with only 73,000 quarters in 1910, and 45,000 quarters in 1909. The largest quantity previously returned in September was 271,000 quarters in 1906.

Oats averaged 18s. 10d. per quarter in 1911, or 1s. 6d. more than in the previous year. The price during the three months September to November averaged 19s. 8d. in 1911 as compared with 16s. 4d. in 1910.

A statement of seven years' prices for oats, similar to those given for wheat and barley, is given in the first table on page 194.

The price of oats, unlike that of barley, normally falls somewhat sharply when the new crop comes into the market. In 1911 the weekly average rose from 17s. per quarter in the first week of January to 19s. 11d. in mid-July. The average then fell to 17s. 10d. at mid-August, but the upward movement was then resumed until the highest weekly price of the year, 21s. per quarter, was reached in mid-November, and was followed

by a slight decline to 20s. 7d. at the end of the year. As in the case of harley and wheat, the September sales were unusually heavy.

Year.	Annual Average.	Monthly Averages.		
		Highest.	Lowest.	Range.
	s. d.	s. d.	s. d.	s. d.
1905 - -	17 4	19 4	15 11	3 5
1906 - -	18 4	20 3	16 2	4 1
1907 - -	18 10	20 10	17 4	3 6
1908 - -	17 10	18 5	17 0	1 5
1909 - -	18 11	21 11	17 0	4 11
1910 - -	17 4	18 1	16 1	2 0
1911 - -	18 10	20 10	17 2	3 8

The higher annual average prices of barley and oats resulted in a rise in the septennial average price of corn, and the value of 100l. of tithe rent charge was increased by 1l. 10s. 0½d. to 72l. 14s. 2½d. for 1912.

The average price of bread per 4 lb. loaf in various districts of Great Britain, calculated from returns collected by the Board of Trade, is given in Table 54. For the country as a whole the 4lb. loaf averaged 5½d. in 1911, or nearly ¼d. less than in 1910.

Meat.

The prices of all fat stock and meat generally declined in 1911 from the high level of those ruling in 1910, as will be seen in the following tables for fat stock (in English markets) and meat respectively :—

Year.	Cattle.		Sheep.	Pigs.	
	Foiled Scots.	Shorthorns.	Downs.	Porkers.	Baconers.
	Per stone. s. d.	Per stone. s. d.	Per lb. d.	Per stone. s. d.	Per stone. s. d.
1906-10	8 2	8 0	8½	7 5	6 11
1910	8 9	8 7	8½	8 4	7 10
1911	8 5	8 2	7¾	7 3	6 8

The prices of cattle, though lower in 1911 than in 1910, were above the average of the years 1906-10; sheep and pigs, on the other hand, were cheaper than in any of the previous five years, except 1908 for pigs and 1909 for sheep. During the closing months of 1911 cattle and sheep showed an improvement in value, but pigs were at a lower level in November and December than at any previous period in the year.

The table for meat shows the average price per cwt. for the first quality of several classes :—

Year.	Beef.				Mutton.			Pork.	
	Scotch Long Sides.	Eng-lish.	Port killed.	Argen-tine Chilled, H.Q.	Eng-lish.	Argen-tine.	New Zealand.	British.	For-eign.
1906-10	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.	s. d.
1910	57 6	53 0	52 6	43 0	67 6	33 0	38 6	61 0	59 6
1911	61 6	56 6	56 6	43 6	66 0	34 0	38 6	68 0	67 0
1911	57 0	54 0	54 0	40 0	63 6	33 0	37 0	60 6	57 0

The prices of all classes of meat were lower in 1911 than in 1910. English and port-killed beef, however, made more than the average of the five years 1906-10, Scotch long sides were slightly under the average, and Argentine chilled beef was much lower. English and New Zealand mutton were below the average price, as also was pork. Bacon fell in value during the year, except for the normal summer rise; Irish bacon, at 56s. 6d. for first quality in December, was 11s. 6d. per cwt. less than in December 1910, and best Canadian bacon showed a fall of 9s. 6d. in the same month. The price of hams, which had steadily risen during 1910, declined in 1911 until May and June, and subsequently again rose. Best Cumberland hams were 2s. 6d. per cwt. cheaper, Irish hams 1s. dearer, and American hams 11s. 6d. cheaper, on the average in 1911 than in 1910.

Store Cattle.

The prices of store cattle in 1911 were on the whole lower than in the previous year, but the range of values was unusually wide, and for the same class of cattle variations of over 2l. per head between spring and autumn were common. On the year's average the fall in price might be put at about 10s. per head, as compared with 1910, though it was still slightly above the average of the five years 1906-10.

The wide range of the seasonal prices is shown in the table on page 196, which gives the monthly average values per head of first quality two-year-old stores of three of the principal breeds.

It will be seen that prices in 1911 were at their maximum in April and May and at their minimum in November. In the early part of the year values were considerably above the average of the previous five years, but in the later months they were below or barely equal to it. The following figures, showing the extent of the fall per head between April or May and November on the average of 1906-10 and in 1911, illustrate the depreciation in values, due, no doubt, to the shortage of roots, hay and straw in England consequent upon the

exceptional drought of the summer:—Shorthorns, 1906-10, 7s. per head; 1911, 42s.; Herefords, 1906-10, 13s.; 1911, 40s.; Polled Scots, 1906-10, 32s.; 1911, 72s. per head.

Among Down and Longwool store sheep there was a considerable fall in price as compared with 1910, values receding to about the level of 1909. On the other hand, Scotch Cross-breds and Half-breds rose slightly in price, while Cheviot and Black-faced sheep remained about the same.

The following table of the monthly average prices of three classes of store sheep compares the quinquennial prices for first quality with those of the past year:—

Year.	January.	February.	March.	April.	May.	June.

1911	—	15 11	15 1	15 10	17 7	16 6

In an ordinary year store sheep reach their highest value about May in England and June in Scotland, and their minimum about August in England and August or September in Scotland. The average range in 1906-11 between maximum

and minimum prices was 13s. 4d. per head for Downs or Longwools, 13s. 1d. for Scotch Cross-breds, and 12s. for Black-faced. In 1911 the range of average prices was, however, 18s. 2d. for Downs or Longwools, 15s. 8d. for Scotch Cross-breds, and 11s. 6d. for Black-faced. The difference in 1911 was not much more than normal in Scotland, but much greater than usual in England, where the effects of the drought upon supplies of winter keep were most severely felt.

The following diagram exhibits the monthly fluctuations in the prices of store cattle and sheep in 1911 compared in each case with the five years' average 1906-10:—

Milk.

One of the principal results of the prolonged drought and the consequent bareness of the pastures during the summer of 1911 was a great increase in the price of milk during the latter part of the year. A comparison of average prices per imperial gallon in 1911 with those of the two previous years is shown in the following table:—

Year.	London.			Birmingham, New St. Station.	Manchester, Mayfield Station.	Edinburgh.	Glasgow.
	Easton, King's Cross, and St. Pancras Stations.	Liverpool St. and Stratford Stations.	Paddington and Waterloo Stations.				
1909	d. 8½	d. 8½	d. —	d. 8½	d. 8½	d. 10	d. 9½
1910	9½	9	9	8½	9	10	9½
1911	9½	10½	10	9½	9	10½	9½

These prices represent "Station" milk, except at Edinburgh and Glasgow, where they represent sales to retailers, and as the great bulk of the milk trade is conducted by contract they afford only a rough indication of values. From week to week they may be regarded as affording some indication of scarcity or plentifulness of supplies, and summarised for longer periods they give an index to relative values.

The detailed monthly average prices are shown in Table 61. The trade in January commenced with supplies usually sufficient for the demand, which became firmer towards the close of the month, and station prices tended upwards. Buyers were reported to be keenly on the look-out in the country for milk for Lady Day contracts, and in some instances were already offering higher prices than in the previous year. After the middle of February supplies increased, and prices fell in March and April. At mid-April the Manchester Reporter stated that of the Lady Day contracts, most of which had then been made, three-fourths had been made to cover the whole year from April to March, and the remainder from April to September only. Prices were:—Yearly contracts, summer six months, $7\frac{1}{2}d.$ to $7\frac{3}{4}d.$, winter six months, $9\frac{1}{4}d.$ to $10d.$ These prices showed an increase over the previous year of $\frac{1}{4}d.$ to $\frac{1}{2}d.$ per imperial gallon.

In May the supplies of surplus milk were very large, and prices generally fell to the lowest level of the year. During June supplies began to be slightly less plentiful, but the drought did not seriously affect the markets until mid-July, when supplies became short and prices rose suddenly, especially in London, as much as $23d.$ per imperial gallon being paid at Liverpool Street and Stratford Stations. The scarcity of milk continued in August, and supplies were also somewhat affected by difficulties of transit, the price in London averaging $12\frac{1}{4}d.$, in Birmingham $12\frac{1}{2}d.$, and in Manchester $11d.$, as compared with $8d.$, $6\frac{1}{4}d.$, and $7d.$, respectively in August of 1910.

In September supplies increased at Manchester and prices fell, but in London the scarcity of milk continued, and the average price at the railway termini rose to $12\frac{3}{4}d.$ At Euston, King's Cross, and St. Pancras as much as $2l.$ per churn, or $28d.$ per imperial gallon, was paid in some instances during the third week of the month. Farmers in some cases made contracts for the London market at $11d.$ to $12d.$ per imperial gallon for the seven months October to April. At Manchester yearly contracts were freely made at $11d.$ for the winter and $8d.$ for the summer months, while a few contracts for winter months only were arranged at $12d.$ per imperial gallon. At Glasgow no rise in the prices of farmers' contracts was reported.

During October supplies of milk became more plentiful, and prices fell generally to a normal level, and in December slightly below it, owing to the mild open weather.

Butter, Cheese, and Eggs.

Dairy produce naturally rose in price concurrently with the increased price of milk. In the early part of 1911 the quotations for both home-produced and imported butters declined in the markets, as usual, but the rise after midsummer was very marked, and values continued advancing, in many cases, until the end of the year. Thus in the latter part of the year first quality British butter made 16s. 3d. per 12 lbs., as compared with 12s. 3d. in June; Irish creamery made 13s. 6d. per cwt., as compared with the previous monthly minimum average of 10s. 6d.; Irish factory, 12s. 6d., as compared with 9s. 6d.; Danish, 14s., as compared with 11s. 6d.; Russian, 12s. 6d., as compared with 9s. 6d.; Canadian, 12s., as compared with 10s. 6d.; Australian, 13s. 6d., as compared with 10s. 6d.; New Zealand, 14s., as compared with 10s. 6d.; Argentine, 13s. 6d., as compared with 10s. 6d. The average range of monthly prices for imported butters was about 27s. 6d. per cwt. during the year, and for British and Irish butters the range was even greater.

As compared with 1910, however, best British butter only averaged 3d. per 12 lbs. more, Irish creamery, 7s. per cwt. more, Irish factory and Russian, 1s. more, Danish, 4s. 6d. more, Canadian, 8s. more, and Australian, 2s. more, while New Zealand butter averaged 1s. 6d. less and Argentine 3s. less.

The average prices for first quality of certain representative classes of butter and cheese during the past seven years are as follows:—

Year.	Butter.				Cheese.	
	British.	Irish Creamery.	Danish.	New Zealand.	British Cheddar.	Canadian.
	Doz. lbs. s. d.	Cwt. s. d.	Cwt. s. d.	Cwt. s. d.	Cwt. s. d.	Cwt. s. d.
1905	13 6	109 0	115 0	105 6	68 6	55 6
1906	14 8	111 6	118 6	111 0	73 0	63 0
1907	15 9	108 6	114 6	107 0	76 0	63 0
1908	14 2	116 0	121 6	118 0	72 0	62 0
1909	14 0	111 6	118 6	111 6	73 0	61 0
1910	14 2	112 0	120 0	116 0	71 0	58 6
1911	14 5	119 0	124 6	114 6	77 0	64 6

The price of cheese was higher in the latter half of 1911 than it had been for many years. The records of contract prices at the London County Asylums show that 76s. per cwt., the October contract price of English Cheddar, was last paid in October 1899, while 69s. per cwt. for Canadian Cheddar is the highest price yet paid for imported cheese in these contracts.

The returns collected by the Board from the chief British markets show that in 1911 best Cheddar, at 77s. per cwt., averaged 6s. per cwt. more than in 1910. Best Cheshire averaged 4s. 6d. per 120 lbs. more at Chester, Nantwich,

and Whitchurch Cheese Fairs, 3s. more at Liverpool, and 6s. 6d. more at London. Best Canadian, at 64s. 6d. per cwt., was 6s. higher.

Between July and December first quality Cheddar rose 18s. 6d., standing at 87s. per cwt. in the latter month. First quality Canadian rose similarly from 58s. 6d. to 71s. The average rise in best Cheshire cheese between June and December was 23s. 6d. per 120 lbs., the December price in London being as much as 94s. 6d.

During the last three months of 1911 the price of eggs rose considerably in the markets. British eggs, which were quoted at 8s. 4d. per 120 for best in April and May, were returned at 12s. 3d. in September, and 19s. 7d. in November; Irish eggs rose from 8s. 2d. per 120 in May, to 12s. 11d. in October, and 17s. 4d. in December; best Danish eggs, quoted at 9s. 1d. per 120 in May, rose to 17s. 1d. in December.

Wool.

The prices of British wool, as compiled from the returns supplied by the Board's Reporters, are given in Tables 77 and 78.

The returns made by the Bradford Reporter give the monthly average prices for 16 different classes of washed wool, which range from 14½d. per lb. for Southdown hogg wool in January to May, to 7d. for Blackfaced ewe and wether wool in June, November, and December. Compared with the corresponding returns for 1910, 1911 shows an average fall of 1½d. per lb., following an advance in 1910, as compared with 1909, of just over 1d. per lb. In 1910 both hogg and ewe and wether wool rose equally, but in 1911 the former class dropped, on an average, ½d., and the latter only ¼d., per lb.

The usual reports on the country wool sales in June, July, and August were obtained and summarised in the weekly Return of Market Prices. Although prices tended, on the whole, to be slightly lower than in 1910, the fleeces offered were generally in fairly keen demand, and prices were considered satisfactory to sellers. Blackfaced and Scotch Cross-bred wools were, indeed, sold at higher prices than in 1910.

Roots and Fodder.

The monthly average prices realised at the markets for roots sold for cattle feeding in Great Britain during 1911 are shown in Table 70 on page 244. The market prices of mangold averaged about 23s. 6d. in the closing months of 1911, as compared with 16s. 3d. per ton in the corresponding months of 1910, the rise being about 45 per cent. The corresponding average quotations for swedes were 27s. per ton in 1911, and 20s. 6d. in 1910, the increase being about 32 per cent.

The monthly prices of hay and straw, recorded in Table 72, equally show the effects of the season, a marked advance in price after midsummer for Great Britain as a whole being apparent, especially in the case of meadow hay, the quotations for which rose by fully 40 per cent. The records of contract prices at Colney Hatch and Hanwell Asylums in Table 74 show that the contracts made in October of 1911, for the following five months, were made at the highest prices since those of the contract year 1893-4.

The prices in Table 75 of ryegrass hay and oat straw, as struck by the Stewartry Farmers' Club, illustrate the fact that the drought was less severely felt north of the Tweed. The price for hay was 80s. per ton, as in 1910, though otherwise much higher than usual. Oat straw was returned at 53s. per ton, being 3s. more than in 1910, and well above the level of previous years.

Vegetables.

In many respects 1911 was a year of difficulty for growers of vegetables for the market, but those who placed their reliance on potatoes had no reason to complain of the season. In the early months—before the home crop was raised—supplies ran very short and prices ruled high. For first quality of some of the popular varieties the monthly average (*see* Table 69) rose well above 5*l.* per ton. After July prices began to fall as the new crop came in, but the exceptionally good quality of the crop, together with the comparative absence of competitive supplies, and an active demand, from the United States particularly, for exportation, all tended to harden the market and keep prices at a level satisfactory to the producers. A comparison of the seasonal average prices per ton for the first quality of four leading varieties will indicate the general level of the market in each of the past four years:—

If these prices may be accepted as an index to the general level of prices in the years specified, it would appear that in 1911 potatoes realised nearly 25 per cent. more than the average of the three preceding years.

The usual particulars of the monthly and seasonal average prices of vegetables and fruit are shown in Tables 69, 71, and 73. The tables show generally that vegetables were decidedly dearer in 1911 than in 1910, while fruit, on the other hand, was

somewhat cheaper. A comparison made between the seasonal prices of the two years for all the vegetables tabulated on pages 242-3 shows that the 1911 seasonal prices were, on the average, 30 per cent. above those of 1910. The most noteworthy increases of prices were for scarlet runner and dwarf beans, brussels sprouts, cabbage, carrots, lettuce, British and Dutch onions, parsnips, home-grown peas, turnips, and vegetable marrow. Only the following vegetables were cheaper: asparagus, Channel Islands beans, mushrooms, Valencia onions, British and Channel Islands tomatoes.

Fruit.

The prices of fruit tabulated on pages 246-9 show that there was an average fall in the seasonal price of British apples in 1911 of 24 per cent., while American and Canadian apples were 10 per cent. dearer, and Australasian apples 5 per cent. cheaper. Other kinds of British grown fruit were about 4 per cent. cheaper on the year, but different kinds varied, black currants, gooseberries, grapes, raspberries, and strawberries, being dearer.

Hops.

The first report from the Board's Reporter at the London Hop Exchange was received as early as the week ending 31st August 1911, but not much business was done by English merchants until two weeks later, though the demand from Continental buyers of green hops was active. In the third week of September good supplies of new hops became available, but the trade done was still limited, as growers were reluctant to sell. Quotations were then 155s. to 185s. per cwt. for East Kents, 150s. to 180s. for Mid Kents, 145s. to 180s. for Wealds, 130s. to 160s. for Sussex, 160s. to 185s. for Farnhams, and 130s. to 175s. for Worcesters. These prices average about 50s. per cwt. above those current at the same time in 1910, while top quotations were as much as 65s. per cwt. higher. The bulk of the business done, however, was in the lower qualities, and in the last week of the month these showed a marked advance in price.

At the annual hop fair held at Worcester on the 19th September only limited quantities of hops were sold. Poor samples made about 160s., good Fuggles 170s., and choice Bramblings and Mathons 180s. to 200s., per cwt.

During October the demand for all descriptions increased rapidly in the Borough Market; the improvement of prices was most marked in the lower grades, the excellent quality of which made them attractive to customers for copper use. As the scarcity of supplies became more and more evident—it being estimated in the third week of the month that at least 90 per cent. of the 1911 crop had passed out of growers' hands—the demand extended to higher grades. In the last week of October

the quotations at the Borough Market were as follows:—East Kents, 230s. to 240s. per cwt.; Mid Kents, 220s. to 235s.; Wealds, 215s. to 230s.; Sussex, 205s. to 220s.; Farnhams, 200s. to 220s.; Worcesters, 220s. to 240s. At Worcester Market prices advanced steadily during October, as supplies became shorter. At the last market of the month very few growers had any 1911 hops left, and prices ranged from 220s. to 240s. per cwt., free on rail.

November opened with a quieter trade in London, but the demand became more active as the month progressed, and with restricted supplies of 1911 hops on offer, "yearlings," "olds," and "old olds" were in demand and made high prices. The only low-priced foreign hops obtainable were Belgians, which rose in value.

In December quotations continued at a high level. Holders of new hops were firm and the business done was limited. The highest values of the season were returned in the first week of the month, as follows:—East Kents, 250s. to 265s.; Mid Kents, 240s. to 255s.; Wealds, 240s. to 252s.; Sussex, 231s. to 240s.; Farnhams, 230s. to 240s.; Worcesters, 235s. to 250s. Quotations for Kents fell but a very little below these towards the close of the year.

For comparison with the prices of 1910, it may be noted that the average price per cwt., on which the value of the English hop crop was calculated in the Report on Part II. of the Agricultural Statistics of 1911, was 209s. for the 1911 crop, as against 105s. for the 1910 crop.

SUPPLIES OF LIVE STOCK AT MARKETS.

The numbers of fat and store stock entering 51 markets of Great Britain in each quarter of last year are shown in the following table:—

Period.	Cattle.		Sheep.		Pigs.	
	Fat.	Store.	Fat.	Store.	Fat.	Store.
January—March -	252,790	154,124	828,486	220,041	168,674	51,532
April—June -	269,704	252,495	1,125,061	484,051	147,959	67,233
July—September -	242,850	126,091	1,342,314	912,470	140,376	58,724
October—December	268,137	238,600	941,798	654,753	214,152	62,073
Year 1911 -	1,033,481	771,310	4,237,554	2,271,317	671,061	239,613
Year 1910 -	1,059,310	965,770	4,193,816	2,545,836	587,643	192,857
Year 1909 -	1,057,088	953,696	4,322,306	2,620,195	629,694	194,078

The totals for 1910 and 1909 are shown for comparison, and it appears that both fat and store cattle, especially the latter, were shown in smaller numbers in 1911 than in either of the two preceding years. It was in the first half of

1911 that fewer fat cattle were offered, but the supplies of stores were considerably less in each quarter of 1911.

Increased numbers of fat sheep were offered from April to September 1911 as compared with the same period of 1910. Supplies of store sheep were larger in the first three months of 1911, but afterwards were smaller than in 1910, especially from October to December.

The supplies both of fat and store pigs placed on the markets in 1911 were considerably larger than in either of the two preceding years.

WEIGHING OF LIVE STOCK.

The percentage of fat cattle weighed among cattle entering the markets in Great Britain scheduled under the Markets and Fairs (Weighing of Cattle) Act rose to 41 in 1911, as compared with 39 in 1910. In England the percentage increased from 25 to 27, and the practice appears to have extended most noticeably at Bridgnorth, King's Lynn, Liverpool, London, Oswestry, and Wellington (Salop).

I have the honour to be, Sir,

Your obedient Servant,

R. H. REW.

3, St. James's Square,
London, S.W.

7th May, 1912.

* Section 8 of the Corn Returns Act, 1882, provides that where returns of purchases of British Corn are made to the local inspector of Corn Returns in any other measure than the imperial bushel or by weight or by a weighed measure that officer shall convert such returns into the imperial bushel, and in the case of weight or weighed measure the conversion is to be made at the rate of 40 imperial pounds for every bushel of wheat, 36 imperial pounds for every bushel of barley, and 33 imperial pounds for every bushel of oats.

VOL. XLVI. PART IV.

IMPORTS AND EXPORTS

OF

CORN, LIVE STOCK, and other AGRICULTURAL PRODUCE,
and Trade in Live Stock with Ireland.

Presented to both Houses of Parliament by Command of His Majesty.

LONDON:

PUBLISHED BY HIS MAJESTY'S STATIONERY OFFICE.

To be purchased, either directly or through any Bookseller, from
WYMAN AND SONS, LTD., PATTER LANE, E.C., and 32, ABINGDON STREET, S.W.; or
OLIVER AND BOYD, TWEEDEDALE COURT, EDINBURGH; or
R. PONSONBY, LTD., 116, GRAFTON STREET DUBLIN;
or from the Agencies in the British Colonies and Dependencies,
the United States of America, the Continent of Europe and Abroad of
T. FISHER UNWIN, LONDON, W.C.

PRINTED BY

EYRE AND SPOTTISWOODE, LTD., EAST HANDBING STREET, E.C.,
PRINTERS TO THE KING'S MOST EXCELLENT MAJESTY.

NOTE.—These publications may be purchased (either directly or through a bookseller) *only* from the agents mentioned on the title-page.

BOARD OF AGRICULTURE AND FISHERIES.

AGRICULTURAL STATISTICS, 1911.

PART IV.

REPORT TO THE SECRETARY OF THE BOARD OF AGRICULTURE AND FISHERIES.

SIR,

I BEG to submit the fourth part of the volume of Agricultural Statistics for 1911, containing detailed statistics of the imports and exports of agricultural produce into and from the United Kingdom specially furnished by the Commissioners of Customs and Excise, and returns of the trade in live-stock between Great Britain and Ireland. These tables were formerly included with the statistics of prices in Part III., but, as previously explained, a division of that Part has this year been made, and the annual volume is now issued in five parts instead of four as previously.

THE GROWTH OF FOOD IMPORTS.

The total value of the chief kinds of imported food included in these tables (other than sugar, rice and lard) was, in 1911, 149,635,000*l.* This was made up as follows, the total quantity being also given :—

	<i>Cwts.</i>	<i>£</i>
Wheat and Flour - - - -	112,047,000	44,187,000
Potatoes - - - -	3,253,000	1,302,000
Meat (including live animals) - -	22,375,000	47,970,000
Butter and Margarine - - -	5,247,000	27,062,000
Cheese - - - -	2,348,000	7,140,000
	<i>Thousands.</i>	
Eggs - - - -	2,287,000	7,968,000
Fruit, Nuts and Vegetables - -	—	14,006,000

The last item includes 8,600,000 bushels of onions, 6,714,000 bunches of bananas, and 14,279,000 cwts. of other fruit, nuts and vegetables.

The growth of these imports may be shown by a comparison of septennial periods. Taking the average of the seven years

1905-11 and the average of the seven years 1856-62, the annual value of these commodities imported, and the average value per head of population, in each period are as follows:—

	1856-62.		1905-11.	
	Value.	Value per head.	Value.	Value per head.
	£	s. d.	£	s. d.
Wheat and Flour - - -	17,876,000	12 6	45,104,000	20 3
Potatoes - - - - -	174,000	0 1½	1,570,000	0 8½
Meat - - - - -	3,584,000	2 6	48,042,000	21 7
Butter and Margarine -	3,217,000	2 3	25,783,000	11 7
Cheese - - - - -	1,249,000	0 10	6,902,000	3 1
Eggs - - - - -	408,000	0 3	7,247,000	3 3
Raw Fruit - - - - -	839,000	0 7	9,073,000	4 1
Nuts - - - - -	367,000	0 3	1,444,000	0 7½
Vegetables (other than Potatoes) - - - -	121,000	0 1	2,477,000	1 1½
Total - - - - -	27,835,000	19 4½	147,642,000	66 3½

The average amount per head spent on these imported foods has, it will be seen, more than trebled.

The expenditure per head of population on all these articles and on wheat and flour and meat respectively is shown in the following diagram, the curves representing the averages in each successive septennium:—

The average quantity per head of wheat imported in 1856-62 was 114 lbs., at a value of 12s. 6d. In the next septennium the quantity increased to 125 lbs., but the value was only 3d. more. In 1870-6 the quantity rose to 170 lbs. and the value to 17s. 11d., and in 1877-83 the quantity reached 232 lbs. and the value 23s. 5d. Since then the quantity per head has further increased, though in a much smaller degree than previously, but the value per head has never again reached so high a figure. In 1884-90 the quantity increased by only 3 lbs. per head and the value fell to 16s. 11d., or 6s. 6d. less than in the preceding period. In 1891-7 the quantity increased to 276 lbs., but the value fell by 2d. In 1898-1904 the quantity was 283 lbs., increasing to 286 lbs. in 1905-11, while the value per head, which had risen to 17s. 6d. in the former period, increased to 20s. 3d. in the last septennium. The largest quantity of wheat (including flour) imported in any single year was 119,000,000 cwts. in 1910, and the highest value in any year was 51,600,000l. in 1909.

Official returns of the home crops of wheat are only available since 1885. In that year the total crop of the United Kingdom was estimated at slightly less than 10,000,000 quarters, and it has never again reached so large a total. Calculated at Gazette prices during the months of September, October and November of the year of harvest, the home wheat crop which realised the most money was that of 1891, when the estimated value of the whole crop was 17,000,000l. During the period 1905-11 the wheat crops of the United Kingdom represented an average supply per head of 80 lbs., at an estimated value of 5s. 1d.

Potatoes may perhaps be regarded, from the point of view of the food supply of the people, as supplementary to wheat, and the figures of imports and home supply may therefore be considered in this connection. The imports of potatoes have never reached serious proportions. In 1856-62 they averaged only 3 lbs. per head at a declared value of 1½d. In 1877-83 they reached a maximum of 22 lbs. at a value of 1s. 1½d., but in the next septennium the figures fell to 7 lbs. at 5½d. In 1898-1904 the imports reached 20 lbs. per head at 11½d., falling in 1905-11 to 12 lbs. at 8½d.

Putting together the figures for imports and home production, the table at the head of p. 282 gives a statement of supplies per head of wheat and potatoes on the average of the past seven years.

These figures must not be taken as representing absolutely the consumption per head of wheat and potatoes respectively in the United Kingdom. The actual human consumption of wheat is somewhat less, and of potatoes considerably more, than is represented by these rates per head. From the home crop of wheat a deduction (of about 6 or 7 per cent.) must be made for seed, while a proportion, which varies from year to year and cannot be precisely estimated, both of imported and home-grown wheat, is consumed by animals and used for other purposes than

	Average per Head of Population.			
	Quantity.		Value.	
	Wheat.	Potatoes.	Wheat.	Potatoes.
	Lbs.	Lbs.	s. d.	s. d.
Imports - - -	286	12	20 3	0 8½
Total Home crop - -	80	334	5 1	10 2
Total - - -	366	346	25 4	10 10½

human food. From the figures for potatoes also a deduction must be made for seed and for a proportion fed to animals and used in manufactures; but, on the other hand, there is a very large supply which is not included in the returns. The home crop above referred is that ascertained by the annual agricultural returns, and includes, therefore, only that which is grown on agricultural holdings exceeding one acre. It is evident that in the matter of potatoes a very large part of the consuming population may be regarded as self-supporting, while the produce of allotments and other plots of ground not exceeding one acre must be in the aggregate very large.

Much the greatest growth of imported food has been apparent in the case of meat, of which in 1856-62 the oversea supply was only 5·3 lbs. per head, while in 1905-11 it was 54·5 lbs. The maximum quantity was received last year, but the maximum value (50,000,000*l.*) was recorded in 1906. The annual imports per head in quantity and value of the three classes of meat in each septennial period were as follows:—

Period.	Beef and Veal.		Mutton and Lamb.		Bacon, Hams and Pork.	
	Quantity.	Value.	Quantity.	Value.	Quantity.	Value.
	Lbs.	s. d.	Lbs.	s. d.	Lbs.	s. d.
1856-62 - -	2·2	1 2	0·6	0 3½	2·5	1 0
1863-9 - -	4·3	2 6	1·3	0 8½	4·2	1 10
1870-6 - -	4·4	2 8	1·8	1 1½	8·7	3 10
1877-83 - -	8·4	4 10	2·1	1 5½	14·6	5 9
1884-90 - -	11·8	5 7	4·3	1 11	13·8	5 3
1891-7 - -	17·9	7 5	7·8	2 8	16·5	6 1
1898-1904 - -	21·3	8 10	10·5	3 5	21·8	8 7
1905-11 - -	22·9	8 5	12·0	3 11	17·4	8 4

In the earlier periods live animals formed the predominant part of the supplies of beef and mutton, but as improved facilities for transport enabled meat to be conveyed any distance without deterioration, the oversea traffic in live animals—subject as it must be to interruption or stoppage by preventive measures against

the introduction of disease, and being also essentially uneconomic when a practicable alternative was provided—has dwindled. The maximum import of live cattle was in 1897, when it represented rather more than 4,000,000 cwts. of beef, and the imports of beef in the carcass was about 500,000 cwts. less. In 1911 over 8,000,000 cwts. of beef were imported in the carcass, while the receipts of live cattle represented 1,300,000 cwts. The trade in mutton is of much later growth, and it was not separately shown in the trade returns until 1882, when it amounted to less than 200,000 cwts., live sheep at the same period averaging about 600,000 cwts. At the present time the importation of live sheep has almost ceased, while mutton and lamb imports amount to 5,500,000 cwts. Owing, no doubt, to the fact that bacon and hams could always be transported for long distances without material injury, the importation of live pigs has never reached very large proportions, and for many years now has practically disappeared. The maximum importation of pig-meat recorded was in 1899, when 8,737,000 cwts. were received. The marked fall in the imports in recent years—shown by the reduction from 21·8 lbs. per head in 1898-1904 to 17·4 lbs. per head in 1905-11—might be attributed, in the absence of any material increase in home supplies, to a declining demand for this kind of meat. The high level of prices which has prevailed, especially for bacon, during the last six years would appear to show, however, that the great reduction of supplies has been due also to other causes, and that although consumption may have diminished partly in consequence of a preference for other foods, the decline has been largely the result of high prices.

Up to the year 1886 butter and margarine were not separately distinguished in the trade returns, and in that year margarine formed about 37 per cent. of the total, the imports of butter alone being 1,500,000 cwts. In 1911 the imports of butter were 4,300,000 cwts., while those of margarine were rather more than 900,000 cwts., or only slightly larger than in 1886.

1905-11 . .	13·1	11 7	6·1	3 1	50	3 3

The average annual imports per head in quantity and value of butter (including margarine), cheese and eggs for septennial periods are shown in the table on the preceding page.

The annual imports of cheese increased pretty steadily from about 400,000 cwts. in 1856 to 2,700,000 cwts. in 1900, since when they have declined, as the septennial head-rate shows, and in 1911 they amounted to 2,300,000 cwts.

Of raw fruit the total imports have increased from an average annual value of about 800,000*l.* in 1856-62 to over 9,000,000*l.* in 1905-11; the value per head having increased just seven-fold. Vegetables (other than potatoes, already referred to) have risen from little more than 100,000*l.* in 1856-62 to nearly 2,500,000*l.* in 1905-11.

IMPORTS IN 1911.

Live Animals and Meat.

The number of cattle imported alive was smaller in 1911 than in any year since 1874. The number received from the United States was somewhat larger than in 1910, but Canadian supplies were again reduced. Imports of live sheep, which had practically disappeared in the two preceding years, reached in 1911 rather more than half the total recorded in 1908. From the United States supplies were nearly as large as in 1908, but from Canada they reached less than a sixth of the number imported in that year.

The recent falling-off in the live imports is succinctly shown by a comparison of the figures for 1911 with those of the previous decade. In 1901-10 the average numbers imported annually were: cattle, 450,960; sheep, 189,278; while in 1911 the numbers were: cattle, 200,398; sheep, 47,673.

On the other hand, the imports of beef and mutton exhibit a practically uninterrupted increase from year to year. A similar comparison with the previous decade shows that the average yearly imports in 1901-10 were: beef, 5,740,659 cwts.; mutton, 4,249,872 cwts.; while in 1911 the imports were: beef, 8,089,107 cwts.; mutton, 5,474,614 cwts.

The following statement gives, for each of the past five years, the total imports of meat, including the estimated weight of live animals, in thousands of cwts. :—

Year.	Beef.		Mutton.		Pig-meat.	Unenumerated (excluding Rabbits).	Total of Meat.
	Live.	Dead.	Live.	Dead.			
1907 -	3,064	6,034	59	4,618	7,320	780	21,876
1908 -	2,475	5,998	44	4,451	7,754	900	21,622
1909 -	2,062	6,584	4	4,887	6,441	906	20,884
1910 -	1,403	7,557	Nil*	5,556	5,290	916	20,722
1911 -	1,294	8,089	26	5,475	6,513	978	22,375

* Less than 1,000 cwts.

The total imported supply of all kinds of meat was thus the largest on record, and considerably greater than in 1910 and 1909. The supplies of pig-meat were 23 per cent. more in 1911 than in 1910, owing to increased arrivals of bacon and hams from North America, but the increased total is still considerably below the level of the years prior to 1909.

Imports of chilled beef rose from 3,192,000 cwts. to nearly 4,000,000 cwts., the Argentine Republic sending all the additional supply. Supplies from North America fell from 470,000 cwts. to 169,000 cwts. The Argentine supply of frozen beef increased, but the Australian supply was smaller.

The receipts of fresh mutton from the Netherlands declined from 140,000 cwts. to 113,000 cwts. The frozen supply from Argentina rose from 1,420,000 cwts. to 1,782,000 cwts., but Australasian consignments fell from 3,630,000 cwts. to 3,273,000 cwts.

The imports of fresh and refrigerated pork slightly declined, but those of bacon rose from 3,863,000 cwts. to 4,869,000 cwts. Of the additional supply Denmark sent 328,000 cwts., the United States 511,000 cwts., and Canada 204,000 cwts. The supply of hams from the United States rose from 666,000 cwts. to 887,000 cwts., and those from Canada from 38,000 cwts. to 62,000 cwts.

The total value of poultry (alive or dead) imported was 918,000*l.* in 1911, as compared with 821,000*l.* in 1910. Supplies from Russia, Austria-Hungary, the United States, Canada, and other British Possessions were larger.

The proportions of the overseas meat supplies derived from within and without the British Empire during the past five years are shown in the following statement:—

1909	19·1	80·9	62·1	37·9	7·7	92·3	25·0	75·0
1910	23·0	77·0	67·7	32·3	8·8	91·2	30·6	69·4
1911	15·5	84·5	61·6	38·4	11·0	89·0	25·2	74·8

While, on the whole, one-fourth of our imported meat in 1911 came from within the Empire, this was mainly attributable to the supplies of mutton from Australasia, from whence nearly two-thirds of the total were sent, the other main source of supply being Argentina, which sent seven-eighths of the remainder.

From Australasia also came practically all the British beef imported, but for the small supply of pig-meat which did not come from foreign countries Canada was almost entirely responsible.

Dairy Produce.

The total receipts of butter from abroad in 1911 were 4,303,000 cwts., or 23,000 cwts. less than in 1910. The imports from Russia, Sweden, the United States, Australia, and Canada were larger, but those from Denmark, the Netherlands, France, Argentina, and New Zealand were smaller than in 1910. Of the total quantity received, 1,707,000 cwts. were from Denmark, 896,000 cwts. from Australia, and 638,000 cwts. from Russia.

Imports of margarine declined from 1,121,000 cwts. to 944,000 cwts. in 1911, nearly the whole of the reduction occurring in supplies from the Netherlands, from which country 896,000 cwts. were received last year.

The total importation of cheese was 2,348,000 cwts., being 108,000 cwts. less than in 1910. There was a reduction in the supplies from nearly every country, the notable exception being the United States, which sent 150,000 cwts. as compared with 38,000 cwts. in 1910. The consignments from Australia increased from 3,710 cwts. in 1910 to 12,602 cwts. last year.

The imports of eggs in 1911 amounted to 2,287 millions and were the largest recorded since 1904; the total value was 8,000,000*l.* Increased consignments were received from Russia, Denmark, Germany, the Netherlands, Italy, Egypt, and Sweden; the consignments from France, Austria-Hungary, and Morocco were smaller. Of the total supply one-half was from Russia, and one-fifth from Denmark.

The total importation of whole fresh milk in 1911 was 11,200 cwts., being approximately equivalent to 123,400 gallons. The imports took place chiefly in January, February, March, November, and December. A little over three-fourths were from France, and the remainder from the Netherlands.

Corn.

The following table summarises the changes in the imports of corn in 1911 as compared with the previous year, the quantities being given in thousands of cwts. :—

—	1910.	1911.	Increase (+) or Decrease (-).
Wheat (including flour as grain)	119,037	112,047	- 7,010
Barley	18,281	24,545	+ 6,264
Oats	17,495	18,273	+ 778
Maize	37,021	38,602	+ 1,581
Beans	849	1,029	+ 180
Pearl	1,591	2,196	+ 605

The receipts of each kind of corn except wheat were thus larger than in 1910.

The reduction of wheat imports was entirely in the amount imported as grain, which was 98,068,000 cwts. in 1911 as against 105,223,000 cwts. in 1910. The most notable change was in supplies from Russia, which fell from nearly 29,000,000 cwts. in 1910 to 18,000,000 cwts. in 1911. Receipts from the United States, India, Australasia, Roumania and Turkey were greater, but those from Argentina, Chile and Canada were smaller. Supplies of wheat-flour were 100,000 cwts. more than in 1910.

The considerable increase of barley imports was due to larger supplies from Roumania, Turkey, the United States and India. The Russian consignments, which formed 50 per cent. of the total in 1910, amounted in 1911 to only just over one-fourth of the total.

Smaller consignments of oats from Russia, Germany, and Chile were more than balanced by the additional supplies from Roumania, Turkey, Argentina and Canada.

The increased imports of peas were mainly due to the receipt of 1,323,000 cwts. from India, as compared with 651,000 cwts. in 1910.

The supply of beans, though larger than in 1910, did not reach the average supply of 1906-10.

The total importation of maize was 38,602,000 cwts., or 1,581,000 cwts. more than in 1910, but 3,800,000 cwts. below the average of 1906-10. There were, however, some notable variations in the quantities received from different countries. Russia sent 8,441,000 cwts. as compared with 2,583,000 cwts.; Roumania, 11,855,000 cwts. as compared with 5,089,000 cwts.; the United States, 10,437,000 cwts. as compared with 5,198,000 cwts.; and Canada, 1,545,000 cwts. as compared with 788,000 cwts. On the other hand, the imports from Argentina amounted to only 3,648,000 cwts. as against 19,939,000 cwts. in 1910.

Fruit, Vegetables and Hops.

The imports of the principal kinds of raw fruit in 1911 and 1910 are given in the table at the head of p. 288.

The imports of bananas amounted to 6,714,479 bunches in 1911, nearly two-thirds coming from Colombia and Costa Rica, about one-fourth from the Canary Islands, and about one-tenth from the British West Indies. Of the total imports of potatoes, nearly one-third came from the Channel Islands and an almost equal quantity from France.

Hops were imported to only a slightly less extent in 1911 than in 1910, but there was a considerable change in the sources of supply. Germany sent only half the quantity and Canada less than half, but Belgium more than trebled its consignments of the previous year.

BRITISH AND FOREIGN SUPPLIES.

A broad analysis of the receipts from European and non-European countries and from British Possessions of the chief commodities gives the percentage of the supplies in 1911 as follows:—

	Foreign Countries.		British Possessions.
	European.	Non-European.	
	<i>Per Cent.</i>	<i>Per Cent.</i>	<i>Per Cent.</i>
Wheat (including flour in equivalent weight of grain) - - - - -	19·8	31·6	48·6
Meat (live and dead) - - - - -	15·5	59·3	25·2
Butter and margarine - - - - -	75·4	1·1	23·5
Cheese - - - - -	13·4	6·4	80·2
Vegetables, raw:—			
Potatoes - - - - -	56·9	11·0	32·1
Other - - - - -	56·3	27·0	16·7
Fruit, raw (including edible nuts and excluding bananas) - - - - -	70·8	11·6	17·6
Eggs - - - - -	95·0	4·9	0·1

AGRICULTURAL EXPORTS.

The chief export trade in the produce of British farms is that of live-stock, of which the total number and value sent abroad in 1911 was as follows:—

	No.	Value.	Average Value per Head.
		£	£
Horses - - - - -	64,196	1,464,095	23
Cattle - - - - -	4,551	133,175	29
Sheep - - - - -	3,058	30,225	10
Pigs - - - - -	566	6,834	12

Of the horses exported, 17,905 were declared at an average value of under 5*l.*, and 26,584 at an average value of 5*l.* and under 10*l.*, nearly all of these being consigned to Belgium and the Netherlands. The remaining 19,707 may be regarded as representing the export trade from British farms, and the average values of those sent to many countries indicates the character of the animals sent. Thus, to Argentina 269 horses were exported at an average value of 172*l.*, to Brazil 81 at 178*l.*, to Chile 122 at 144*l.*, to Japan 29 at 180*l.*, to Russia 182 at 109*l.*, to Sweden 13 at 250*l.*, and to Uruguay 84 at 182*l.* There was a good demand from within the British Empire. Thus, Australia took 233 at 162*l.*, Canada 1,978 at 61*l.*, India 387 at 141*l.*, New Zealand 33 at 178*l.*, the Cape 203 at 109*l.*, and Natal 190 at 87*l.*

Of the cattle exported for breeding, 551 were sent to Austria-Hungary, 243 to Argentina, 772 to the United States, 136 to Canada, 112 to Rhodesia, 193 to the Cape, and 113 to Costa Rica. The chief buyers of sheep were Argentina 422, Germany 475, the United States 692, and Canada 374. Russia was the principal purchaser of pigs for breeding.

Other agricultural exports of British and Irish produce included 2,336,559 cwts. of potatoes at a declared value of 431,962*l.*, an unusually large amount, but still considerably below the record of 1909, when over 3½ million cwts. of the value of 558,000*l.* were exported. Oats were also exported to the amount of 548,000 cwts., or considerably more than in previous years. The exports of hops amounted to 48,918 cwts. as compared with 8,927 cwts. in 1910. The largest quantity previously exported was 75,647 cwts. in 1862. The total value of hops exported in 1911 was 350,000*l.* Germany took 16,000 cwts. at a value of 155,000*l.*, and Belgium 19,000 cwts. at 98,000*l.*

I have the honour to be, Sir,

Your obedient Servant,

R. H. REW.

3, St. James's Square, S.W.

8th July 1912.

AGRICULTURAL STATISTICS OF GREAT BRITAIN.

The annual AGRICULTURAL STATISTICS for 1911 are issued in five parts, as follows :—

Part I.—(Cd. 6021, price 5½d.)

Report.

Tables: Section I.—Area under Crops and Live Stock.

" " II.—Value of Land.

Part II.—(Cd. 6056, price 4½d.)

Report.

Tables: Section III.—Produce of Crops.

" " IV.—Weather Statistics.

Part III.—(Cd. 6372, price 4½d.)

Report.

Tables: Section V.—Prices of Corn and Bread.

" " VI.—Prices of Live Stock and other Agricultural Produce.

" " VII.—Supply of Live Stock at Markets.

Part IV.—(Cd. 6385, price 5½d.)

Report.

Tables: Section VIII.—Imports of Agricultural Produce.

" " IX.—Exports

" " X.—Trade in Live Stock with Ireland.

Part V.—(Cd. 6588, price 7½d.)

Report.

Tables: Section XI.—Agricultural Statistics of the British Empire.

" " XII.—Foreign Agricultural Statistics.

" " XIII.—Comparative Statistics of Acreage and Produce of Crops and Live Stock in various Countries.

" " XIV.—Colonial and Foreign Prices of Agricultural Produce.

NOTE.—These publications may be purchased (either directly or through a bookseller) *only* from the agents mentioned on the title-page.

INDEX TO VOLUME XLVI.	495

BOARD OF AGRICULTURE AND FISHERIES.

AGRICULTURAL STATISTICS, 1911.

PART V.

REPORT TO THE SECRETARY OF THE BOARD OF AGRICULTURE AND FISHERIES.

SIR,

I SUBMIT the fifth part of the Agricultural Statistics, 1911, completing the volume for that year. It comprises such returns as are available for 1911, and some previous years, of the acreage and production of crops, the number of live stock, and the prices of agricultural commodities in the British Empire and foreign countries, the particulars corresponding to those given in Part IV. in previous years.

The first part of the annual volume, containing detailed returns of acreage and live stock in Great Britain, was published on the 17th January 1912; the second part, containing particulars of the total production and yield per acre of crops in Great Britain, was issued on the 23rd February; the third part, containing statistics of prices and supplies of live stock and agricultural commodities in Great Britain, appeared on 6th July; and the fourth part, containing statistics of imports and exports of corn, live stock, and other agricultural commodities into and from the United Kingdom, was issued on the 4th August last.

In the first section of the present part are given tables relating to the British Empire, including the United Kingdom. Details of acreage, produce, and live stock are given for British India and Ceylon, for the Commonwealth of Australia and each of its states, and for the Dominion of Canada and each of its provinces, including British Columbia, for which figures are given in greater detail than previously. For the Union of South Africa, details for Natal and certain particulars for the Cape of Good Hope and the Orange Free State are given as before, while a new table is added for the Transvaal. A table is given for New Zealand, and in Tables 182 and 183 certain returns of acreage and live stock are given for various other units of the Empire.

In the foreign section tables are given for 19 European countries, and for Algeria, Argentina, Chile, Egypt, Japan, Mexico, Russia in Asia, Tunis, the United States, and Uruguay. New tables (211 and 212) have been added, giving certain

figures for countries for which only limited information is available. For the first time statistics are included for parts of China and of the Ottoman Empire, while Costa Rica, Cuba, Erythria, Nicaragua, Peru, Portugal, and Italian Somaliland are also included in these tables.

Altogether, returns more or less complete are included herein from 76 territories which may be described as statistical units, of which 38 are parts of the British Empire. In my report on the corresponding part for 1910, I remarked that 69 different statistical units were therein comprised. The area of information is, it will be observed, extending, and we appear to be coming within measurable distance of the time when something like a complete statistical account of the agricultural exploitation of the world may be possible. To this result the influence of the International Agricultural Institute contributes. Indeed, it is taking up and widening the work in this sphere, which for many years the International Statistical Institute, by more indirect methods, performed and in which it may be said to have been the pioneer.

CHANGES IN 1911.

I give below, for such countries as have published returns for both 1910 and 1911, a summary of the year's changes in the

Country.	Wheat.	Barley.	Oats.	Rye.	Maize.	Potatoes.

* Years 1910-11 and 1911-12.

† Including Croatia and Slavonia.

acreage of wheat, barley, oats, rye, maize, and potatoes; the figures representing the increase (+) or decrease (-) in thousands of acres (000's omitted).

Last year particulars for 25 States were given in the corresponding table. This year 27 are included, but two, Luxemburg and Switzerland, for which comparative figures are again available, are omitted this year as the changes were too small—less than 1,000 acres in any crop—to be shown.

The expansion of the **wheat** area continued almost universally, the most notable exceptions being France, Hungary, Algeria and Mexico. The wheat fields of the British Empire—not counting the smaller areas—extended by 1,071,000 acres, a diminution in New Zealand being nearly counterbalanced by an increase in the United Kingdom. In Europe there was a net addition of 750,000 acres, reductions in France and Hungary being more than made up by extensions in Russia and, to a smaller degree, in Spain. In the United States the wheat area increased by 3,862,000 acres, or $8\frac{1}{2}$ per cent., in Argentina by 1,590,000 acres, and in Asiatic Russia by 1,406,000 acres. Altogether in the countries for which comparison is possible there was a net addition in 1911 of 7,974,000 acres to the area under wheat, following an addition of over 15,000,000 acres shown in these tables last year.

The gains and losses in the area under **barley** very nearly balanced each other, but on the whole a reduction of 69,000 acres was shown. In the British Empire 573,000 acres were lost to this crop in Canada and the United Kingdom.

The area under **oats** was reduced in Canada by 664,000 acres (being slightly more than the addition recorded in the previous year), while reductions in the United Kingdom and Australia were nearly set off by an increase in New Zealand. The chief additions were recorded in Argentina and Asiatic Russia, and the net gain in the countries included in the table was 760,000 acres.

In only four countries was there any substantial extension of the acreage under **rye**, but in Russia the addition amounted to $2\frac{1}{2}$ million acres, the total net increase over all the countries named being rather less than 2 million acres.

The changes in the acreage under **maize** were not very great in the European countries which return this crop, though there was a general tendency to increase; especially in Roumania and Russia. There were, however, additions of 1,790,000 acres in the United States, 1,287,000 acres in Mexico, and 510,000 acres in Argentina, though there was a reduction of 562,000 acres in Asiatic Russia. On the whole, a net increase of 3,632,000 acres was shown.

The area under **potatoes** increased in 1911 in every country for which returns are available, with the exception of Australia,

Canada, and the United States, the net increase over 14 countries being 179,000 acres.

The number of countries for which a comparison is possible of the numbers of **live stock** in the two years is very limited. In the United Kingdom increases in 1911 of 100,000 cattle and 687,000 pigs, and decreases of 680,000 sheep and 61,000 horses, were recorded. In Australia all classes of stock increased; cattle by 13,000, sheep by 1,038,000, pigs by 83,000, and horses by 109,000. In Canada pigs increased by 38,000 and horses by 53,000, but cattle decreased by 28,000 and sheep by 209,000. For the United States, a comparison between the census returns collected on the 15th April 1910 and the annual returns collected on 1st January 1911 would show considerable changes, but owing to difference in date and in mode of collection such a comparison is unsatisfactory. Comparing the returns for 1st January 1911 with those for 1st January 1912 the following changes appear:—

—	On 1st Jan. 1911.	On 1st Jan. 1912.	Increase + or Decrease —	
			Actual.	Per cent.
	Thousands.			
Cattle:—				
Milch Cows - -	20,823	20,699	— 124	— 0.6
Other kinds - -	39,679	37,260	— 2,419	— 6.1
Total - -	60,502	57,959	— 2,543	— 4.2
Sheep - - - -	53,633	52,362	— 1,271	— 2.4
Pigs - - - -	65,620	65,410	— 210	— 0.3
Horses - - - -	20,277	20,508	+ 231	+ 1.1

WHEAT AND POPULATION, 1901-11.

The results of the population census taken in many countries in 1911 or 1910 being now available, the opportunity may be taken of making an approximate comparison of the extension of the wheat area and the growth of population since the preceding census.

For this purpose the United Kingdom, Australia, Canada, India, and New Zealand may be taken as representing the British Empire, and a marked increase both of wheat area and population is shown in the later year. The figures (in thousands) are given in the following table.

In each of the great divisions of the Empire the extension of the wheat area has been much greater than the increase of the population. In 1901 there were nearly 35 million acres, or about one-eighth of an acre for each of the 283 million inhabitants; in 1911 there were 50 million acres, or about

Country.	Wheat Area.				Population.			
	1901.	1911.	In-crease.	Per Cent.	1901.	1911.	In-crease.	Per Cent.
	<i>Thousands of Acres.</i>				<i>Thousands.</i>			
United Kingdom	1,746	1,952	206	11·8	41,587	45,365	3,828	9·2
Australia -	5,116	7,428	2,312	45·2	3,833	4,449	616	16·1
Canada -	4,225	10,377	6,152	145·6	5,371	7,205	1,834	34·1
India -	23,446	30,518	7,072	30·2	231,856	244,127	12,271	5·3
New Zealand -	163	215	52	31·9	788	1,008	220	27·9
Total -	34,696	50,490	15,794	45·6	283,886	302,154	18,769	6·6

one-sixth of an acre for each of the 302 million inhabitants. If the whole of this acreage were as productive as the 2 million acres in the United Kingdom, it would very nearly suffice for the total requirements of the present population, assuming that they were all wheat-eaters and that their average consumption per head was the same as that of the inhabitants of the United Kingdom. These assumptions are, of course, far from the facts at present. The average yield per acre of wheat, which in the United Kingdom is 33 bushels, is in Australia 12 bushels, in Canada 17½ bushels, in India 11½ bushels, and in New Zealand (with much the smallest acreage) 29 bushels. On the other hand, a large proportion of the inhabitants of India do not eat wheat. If India be eliminated, we find that in the United Kingdom, Australia, Canada, and New Zealand the wheat area has increased from 11½ million acres in 1901 to 20 million acres in 1911, or by 78 per cent., while the population has increased from 51½ millions to 58 millions, or by 13 per cent., in the same period.

A similar comparison is possible for 11 European countries as follows :—

Country.	Wheat Area.				Population.			
	1901.	1911.	Increase or De-crease.	Per Cent.	1901.	1911.	In-crease.	Per Cent.
	<i>Thousands of Acres.</i>				<i>Thousands.</i>			
Austria -	2,642	3,001	+ 359	+13·6	26,204	28,568	2,364	9·0
Belgium -	409	378	- 31	- 7·6	6,694	7,490	796	11·9
Bulgaria -	2,039	2,762	+ 723	+35·5	3,789	4,317	528	13·9
France -	16,781	15,688	- 1,113	- 6·8	38,962	39,602	640	1·6
Germany -	3,906	4,876	+ 970	+24·8	56,806	61,926	5,120	14·3
Hungary -	8,863	9,157	+ 294	+ 3·3	19,363	20,886	1,523	7·9
Netherlands -	134	142	+ 8	+ 6·0	5,263	5,945	682	13·0
Roumania -	4,042	4,768	+ 726	+18·0	6,001	7,087	1,086	18·1
Russia -	49,589	63,726	+14,137	+28·5	107,458	135,859	28,401	26·4
Sardinia -	753	955	+ 202	+26·8	2,547	2,912	375	14·8
Spain -	9,168	9,702	+ 534	+ 5·8	18,608	19,589	981	5·3
Total -	98,326	115,105	+16,779	+17·1	291,685	337,181	45,496	15·6

The figures for Russia at both periods refer to the 63 Governments of European Russia, the population figures at the earlier date being, however, those for 1897. In three countries the population figures in the column headed 1901 really relate to 1900, while in many instances, in the absence of returns for 1911, the figures for 1910 are used. In each of these European States—with the exception of Belgium and France—the area under wheat has increased, the extension being most marked in Bulgaria, Russia, and Servia. The apparent extension in the case of Germany is due to exceptional conditions in 1901. On the whole, however, the increase of the wheat area has fully kept pace with the increase of population. But there is, perhaps, even less direct relation between wheat area and population in this table than in the preceding table, a very large proportion of the inhabitants of several of the States being consumers mainly of rye. But the salient fact is that while the population of these countries has increased by 45 millions, the area of wheat within their territories has expanded by over 16 million acres.

Outside the British Empire and Europe comparative figures are available for six countries as follows:—

Country.	Wheat Area.				Population.			
	1901.	1911.	Increase or De-crease.	Per Cent.	1901.	1911.	In-crease.	Per Cent.
	<i>Thousands of Acres.</i>				<i>Thousands.</i>			
Algeria -	3,251	3,303	+ 72	+ 2·2	4,739	5,564	825	17·4
Argentina -	8,141	17,036	+ 8,895	+109·3	4,625	7,172	2,547	55·1
Japan -	1,194	1,223	+ 29	+ 2·4	44,710	50,939	6,229	13·9
Siberia and Steppes -	4,723	9,505	+ 4,782	+101·2	7,241	10,218	2,977	41·1
U.S.A. -	49,896	49,513	- 383	- 0·7	77,647	93,793	16,146	20·8
Uruguay -	728	798	+ 70	+ 10·4	935	1,132	197	21·2
Total -	67,908	81,408	+13,500	+ 19·9	139,927	168,818	28,891	20·4

The population figures for Siberia and the Steppes are those for 1897 and 1910, and for Argentina, Japan, and Uruguay also the later figures are those of 1910. In this group of countries it will be seen that the extension of the wheat area has not quite kept pace with the growth of population owing to the fact that wheat cultivation in the United States appears to have remained stationary. The wheat acreage changes in the United States are not very easy to follow, and the recorded fluctuations from year to year are considerable. If the census figures for the years 1899 and 1909 are taken, a marked decrease in the wheat area is shown, but, on the other hand, the figures published by the Agricultural Department for 1900 and 1910 show an increase. On the whole, however, it appears reasonable to assume that the wheat area of the United States has remained practically stationary for about a decade, a fact which is corroborated by the very marked decline in her wheat

exports. This is a significant fact which must be taken into account in any calculations of probable food supplies in the future. So far as this small and heterogeneous group of countries is concerned, the deficiency in relation to population of the United States has been made good by Argentina and Asiatic Russia.

By putting together the figures for each of these three groups of countries, we may obtain a rough approximation of the general progress of wheat growing in relation to population, or, in other words, some indication of the extent to which the world's supplies of wheat are keeping pace with the world's demand. For such a speculation, figures of acreage are perhaps more trustworthy than estimates of production, which are subject to considerable yearly fluctuation, but it may be observed that, on the whole, the productiveness of the world's wheat area probably tends to increase as the newer lands under this crop become better farmed.

So far as the United Kingdom—the chief wheat buyer of the world—is concerned, it is expansion in the great wheat-selling countries that is of main interest. The continuance of a large surplus over home requirements in those countries is of vital concern to us.

The expansion or contraction of that surplus and the probabilities of its continuance or cessation would form a subject for much more detailed examination than can be attempted here, but a few figures based on the returns of the past three years (1909–11) may be mentioned as indicative of the amount of surplus wheat coming to this country. During that period the largest quantity—5 million quarters per annum—came from Russia, and this represented only $5\frac{1}{2}$ per cent. of the total crop in that country. The United States also sent us nearly 5 million quarters per annum during the three years, representing just over 6 per cent. of their crop. Canada sent $4\frac{1}{2}$ million quarters, representing 21 per cent. of her crop, and Argentina, with nearly 4 million quarters, sent the same proportion of her total production. India sent us 4 million quarters, representing 9 per cent. of her crop, while Australia's contribution of 3 million quarters represented no less than 28 per cent. of her wheat crop on the average of those years. Chile and New Zealand, though supplying only comparatively small quantities, sent us 10 and 15 per cent. respectively of their wheat crops. The important question for the not far distant future is the rapidity with which the increasing demands of their own population will allow these countries to maintain the exportation of these supplies.

The summary of the three preceding tables gives the statement at the head of the next page.

These figures, so far as they go, are sufficiently reassuring. They include the greater part of the wheat-growing territories and most of the wheat-eating peoples of the world, and there is

Groups of Countries.	Wheat Area.				Population.			
	1901.	1911.	In-crease.	Per Cent.	1901.	1911.	In-crease.	Per Cent.
	<i>Thousands of Acres.</i>				<i>Thousands.</i>			
British Empire (3)	34,696	50,490	15,794	45.5	283,365	302,154	18,769	6.6
Europe (11)	98,326	115,105	16,779	17.1	291,685	337,181	45,496	15.6
Others (6)	67,908	81,408	13,500	19.9	139,927	168,818	28,891	20.6
Total	200,930	247,003	46,073	23.9	714,977	808,153	93,156	13.0

no reason to think that the inclusion of the countries for which figures are not forthcoming would substantially affect the general conclusion to be drawn from this table, viz., that the supply of wheat is at present keeping pace with the increasing demand for it. From the British point of view it is especially interesting to note that, within the limits of the Empire, the expansion of the wheat area has been much more markedly in excess of the growth of population than in other parts of the world.

AGRICULTURE IN RELATION TO POPULATION.

Some indication of the food resources of different countries, as well as their exporting capacity, may be obtained by calculating the extent of land devoted to the chief crops of general production and of the farm live stock in relation to the present population. For example, there are, for every 1,000 inhabitants in the United Kingdom, 43 acres of wheat, while in Saskatchewan there are 10,635 acres, and in Manitoba 7,323 acres. For the chief corn crops and potatoes, the following table shows the number of acres per 1,000 of population in the United Kingdom, Australia, Canada, and New Zealand:—

Country.	Wheat.	Barley.	Oats.	Maize.	Potatoes.
United Kingdom . . .	43	39	90	—	26
Australia	1,670	25	139	77	34
Canada	1,440	195	1,282	44	64
New Zealand	214	31	400	6	31

The variations in different parts of the great Dominions have a wide range. Thus in South Australia there are 5,330 acres of wheat for every 1,000 inhabitants, while in Queensland there are only 71 acres. On the other hand, while there are 255 acres of maize per 1,000 inhabitants in Queensland, there is less than one acre in South Australia. Tasmania has 114 acres of potatoes per 1,000 of population, while Western Australia has only 10 acres. In Canada the excessive wheat acreage of the North-West is to some extent set off by the Eastern Provinces

and British Columbia, where the wheat area is, proportionately to population, less than in the United Kingdom. The number of acres per thousand in New Brunswick is 38, in British Columbia 37, in Quebec 35, and in Nova Scotia 27.

In a corresponding comparison for European countries, rye, which is grown to only a small extent in the British Empire, must be included.

Country.	Wheat.	Rye.	Barley.	Oats.	Maize.	Potatoes.
Austria	105	175	95	162	26	109
Belgium	50	84	11	81	—	63
Bulgaria	640	126	144	103	362	2
Denmark	38	258	219	377	—	51
France	395	73	48	252	26	97
Germany	75	233	60	165	—	126
Hungary	438	140	139	139	340	83
Italy	338	9	18	37	117	21
Netherlands . .	24	94	12	57	—	69
Norway	5	16	38	113	—	44
Roumania	673	46	177	140	727	4
Russia	469	521	207	314	29	81
Servia	328	42	87	89	495	9
Spain	495	101	182	65	58	—
Sweden	44	180	82	354	—	68

In several cases the population in 1910 is the latest available and has therefore been used for the calculation, while for Denmark and Norway the figures relate to 1907, and for Sweden the figures are those of 1910.

A noticeable point in the foregoing table is the relation of wheat to rye. In Austria, Belgium, Denmark, Germany, Netherlands, Norway, Russia, and Sweden, the acreage of rye exceeds the acreage of wheat, and, with the exception of Russia, none of these countries can be classed as wheat-exporting. In the other countries, with the exception of France, Italy, and Spain, the preponderance of wheat is consequent upon the export trade rather than the home consumption.

Country.	Wheat.	Rye.	Barley.	Oats.	Maize.	Potatoes.
Algeria	594	0	604	81	4	—
Argentina	2,375	5	22	355	1,179	18
Chile	289	1	25	17	14	20
Egypt	113	—	32	—	162	—
Japan	24	32	29	2	3	—
Mexico	114	—	95	—	973	—
Russia (in Asia) .	658	127	113	230	39	17
Tunis	521	—	592	77	26	—
United States . .	528	23	81	403	1,128	39
Uruguay	705	—	6	76	494	—

For countries outside the British Empire and Europe the foregoing figures are available, the population in most cases being that of 1910. The figures for Tunis relate to 1909.

Calculations similar to those for the chief crops may be made for farm animals—cattle, sheep, and pigs—and thereby some indication may be afforded of the meat resources of each country, assuming that each were to be restricted to its native supplies. The numbers per 1,000 of population in the British Empire are as follows :—

Country.	Cattle.	Sheep.	Pigs.
United Kingdom	261	672	94
Australia	2,643	20,923	249
Canada	984	332	368
Ceylon	249	23	23
India	298	95	—
New Zealand	2,004	23,836	346
South Africa	752	5,320	125

The wealth in cattle, and more especially in sheep, of Australia and New Zealand, is strikingly shown in this comparison. Of the States of Australia, Queensland is conspicuous with eight times as many cattle and 34 times as many sheep as human inhabitants. In the Union of South Africa the Orange Free State has 1,506 cattle and 15,618 sheep per 1,000 inhabitants. It may be noted that New Zealand has the largest stock of cows in relation to population, the number being 798 per 1,000 inhabitants.

Country.	Cattle.	Sheep.	Pigs.
Austria	321	85	225
Belgium	243	—	182
Bulgaria	420	2,015	115
Denmark	834	269	543
France	367	415	170
Germany	333	124	357
Hungary	350	409	363
Italy	182	327	73
Luxemburg	362	21	493
Netherlands	341	150	212
Norway	469	598	137
Portugal	134	587	212
Roumania	428	936	293
Russia	275	339	91
Servia	329	1,308	297
Spain	130	803	126
Sweden	498	182	173
Switzerland	383	42	151

For European countries the corresponding calculations are shown in the foregoing table.

These figures are for very varying dates, although they are in each case the latest available. For Roumania none can be given for a later year than 1900 and it should be noted that in that country the statistics of cattle include buffaloes. In Russia the statistics for sheep include goats. Bulgaria has no later figures than those for 1905, Portugal than 1906 and Germany and Norway than 1907.

Other countries for which a similar calculation can be made are as under:—

Country.	Cattle.	Sheep.	Pigs.
Algeria	200	1,533	20
Argentina	4,020	10,180	—
Chile	489	1,055	48
Egypt	57	—	—
Japan	27	1	5
Russia (in Asia)	577	1,390	67
United States	645	572	700
Uruguay	7,855	25,203	173

Most of these figures relate to 1910, those for Uruguay being for 1908.

PRICES OF AGRICULTURAL COMMODITIES.

In the last section of these returns (tables 225-245) are collected records of the prices of various agricultural commodities in India, Australia, Canada, New Zealand, Argentina, Austria, Belgium, Bulgaria, Denmark, France, Germany, Hungary, Japan, Netherlands, Roumania, Switzerland, Russia, and the United States. In most cases, the quotations for a series of years are given, and for the purpose of tracing the recent course of prices in any one country for particular commodities they afford a ready means of reference. When, however, an attempt is made to make international comparisons of prices difficulties at once arise. Differences in the class and quality of the commodity, in the system of collecting the returns (some relating to particular markets and others purporting to represent the whole country), in the duties, internal and external, and in other respects, render a comparison of like with like a matter of great difficulty. The difficulty may, however, be to a considerable extent surmounted by reducing the prices for a given commodity to a common numerical measure and comparing the course of prices over a series of years with the average of a certain period. The average price of wheat for the three years 1903-5 has been calculated for a number of countries and, treating this as an index number, a

comparison of the relative values from year to year may be obtained.

For five countries of Western Europe this method gives the following statement of the course of wheat prices:—

Year.	England and Wales.	France.	Denmark.	Belgium.	Nether- lands.
1903-5 (Average) . . .	100	100	100	100	100
1902	99	97	87	96	93
1903	95	100	90	95	95
1904	100	97	106	102	102
1905	105	103	104	103	105
1906	100	104	93	99	100
1907	108	106	123	110	117
1908	113	103	111	114	117
1909	131	107	113	130	138
1910	112	112	106	115	114
1911	112	—	—	—	—

In England and Wales the prices represent the Gazette averages of all qualities of British wheat; in France, Belgium, and Denmark also the average for the whole country and for all qualities is given. In Holland the price taken is the average at Groningen.

The year 1909 appears to have had curiously unequal effects, the price rising 31 per cent. above the average in England and 38 per cent. in Holland, while in France the rise was only 7 per cent. and in Denmark 13 per cent.

For five countries of Central and Eastern Europe the comparison is as follows:—

Year.	Austria.	Bulgaria.	Germany.	Hungary.	Russia.
1903-5 (Average) . . .	100	100	100	100	100
1902	102	104	98	97	—
1903	91	99	94	90	92
1904	107	97	103	107	105
1905	103	103	104	103	105
1906	93	101	106	90	95
1907	116	127	123	116	131
1908	135	143	125	139	150
1909	161	149	137	167	139
1910	135	131	123	135	114
1911	—	—	120	—	—

The figures for Austria represent the average of the highest prices of Theiss wheat, while those for Bulgaria purport to be the average of all classes of wheat for the whole country. For Germany the average of different grades of wheat at Berlin, Munich, Leipzig, Breslau, and Frankfort is taken, and for

Hungary the average prices on the exchange at Budapest. For Russia the average of spring and winter wheat in the Government of Kherson is taken.

It will be observed that the range of yearly values was wider in this than in the former group, and the movements, though mostly in the same direction, were much more violent in some countries than in others. The maximum in these years was recorded in 1909 in each of these countries except Russia.

For another much less homogeneous group of countries a similar comparison may be made as follows:—

Year.	Argen- tina.	Canada.	New South Wales.	India.	Japan.	U.S.A.
1903-5 {Average}	100	100	100	100	100	100
1902 . . .	101	84	112	100	74	88
1903 . . .	91	87	131	95	97	93
1904 . . .	104	107	82	95	98	98
1905 . . .	106	103	87	108	105	107
1906 . . .	104	86	83	111	90	100
1907 . . .	122	98	98	127	102	95
1908 . . .	132	110	109	161	100	120
1909 . . .	—	124	121	148	106	124
1910 . . .	—	113	98	121	110	124
1911 . . .	—	102	—	—	—	112

The price for Argentina is the average at the market of Buenos Ayres, for Canada the average price of two grades of wheat, for New South Wales the general average, for India the average at Calcutta, Delhi, and Karachi, for Japan the general average, and for the United States the market value of home produce at the time and place of exportation.

In these various countries prices, it will be seen, were, except in India, generally more stable than in Eastern and Central Europe, but less so than in Western Europe.

Taking into account all the countries (15) in which the sequence of price records from 1903 to 1910 is complete, it appears that the value of wheat was 3 per cent. below the average of 1903-5 in 1906, but that it rose much above that level in the subsequent years. It was 13 per cent. in 1907, 23 per cent. in 1908, 33 per cent. in 1909, and 18 per cent. in 1910 above the average.

A similar calculation may be made for a few countries of the course of prices of maize and potatoes, and the most important of such records as are available are shown in the following table (*see* page 396).

The price of maize for Argentina is the average at the market of Buenos Ayres, for Bulgaria the general average for

Year.	Maize.			Potatoes.			
	Argentina.	Bulgaria.	U.S.A.	England and Wales.	Germany.	Russia.	U.S.A.
1903-5(average)	100	100	100	100	100	100	100
1902	111	104	120	86	66	—	103
1903	91	100	92	108	85	70	93
1904	96	94	104	107	110	121	134
1905	111	108	100	85	105	109	69
1906	109	100	92	78	69	73	93
1907	120	118	104	114	96	121	86
1908	131	141	136	89	94	115	124
1909	—	137	132	75	92	109	117
1910	—	122	116	84	78	73	72
1911	—	—	120	96	119	—	—

the country, and for the United States the average of No. 2 grade at Chicago.

The prices of potatoes for England and Wales are those of the yearly contracts made for the London Asylums, the Board's market returns not having been established sufficiently long to furnish records earlier than 1904. The prices for Germany represent the average of potatoes for food at Berlin, Breslau, and Magdeburg; potatoes for spirit have a different level of value. In Russia the price quotations for potatoes as for wheat relate to the Government of Kherson, while for the United States the average of Burbank potatoes at Chicago is taken.

International comparisons of the prices of meat are beset with even more difficulties than those of grain prices; but by adopting the same method it is possible to give a fairly trustworthy indication of the movement of values. The following statement represents the price of beef in nine European countries:—

Year.	Great Britain.	Austria.	Belgium.	Bulgaria.	Denmark.	France.	Germany.	Netherlands.	Russia.
1903-5 } (aver.)	100	100	100	100	100	100	100	100	100
1902	114	91	100	85	105	96	94	102	—
1903	102	100	104	90	105	100	97	100	115
1904	100	98	98	100	92	102	98	98	85
1905	100	104	98	115	103	101	105	102	100
1906	98	109	107	125	105	100	109	100	115
1907	102	118	109	120	105	104	111	100	130
1908	105	107	107	125	89	108	103	102	125
1909	107	107	104	130	88	109	101	100	130
1910	112	—	111	135	105	112	113	102	130
1911	107	—	—	—	—	—	—	—	—

The prices for Great Britain are the average of returns from London, Liverpool, and Glasgow. For Austria the prices are the average of returns from Vienna, Linz, Graz, Trieste, and Prague; for Germany the average at Berlin, Munich, Leipzig and Breslau; and for Holland at Amsterdam. For Bulgaria the general average is taken; for Belgium the average at Ghent, Brussels and Liège; for France the average of ox and cow beef; and for Denmark mean export values.

Four extra-European countries may be compared in a similar manner thus:—

Year.	Canada.	New South Wales.	Japan.	U.S.A.
1903-5 (average)	100	100	100	100
1902	—	107	82	128
1903	99	107	89	97
1904	101	87	93	101
1905	100	107	119	102
1906	104	93	120	103
1907	111	107	125	110
1908	120	107	130	116
1909	143	133	114	130
1910	175	133	104	137
1911	169	—	—	—

The price for Canada is that of dressed beef at Toronto, for New South Wales and Japan it is the general official average for beef, and for the United States it is the average of inferior to prime cattle at Chicago.

The European country in which the price of beef has shown least rise and fall during the period is Holland, although in Great Britain and France the price was very stable from 1903 to 1907. The rise in Canada since 1906 has been very marked and in a less degree also in Russia, New South Wales and the United States. In Germany, a rise in 1906-7 was followed by a fall in 1908-9, and a similar and more pronounced movement is indicated in Denmark. On the whole, however, there was a general, and in some countries a very serious, rise in the price of beef in 1909-10.

I have the honour to be, Sir,

Your obedient Servant,

R. H. REW.

30th November 1912.
